Word Processors

How Your Computer Can Help with School or Business Homework

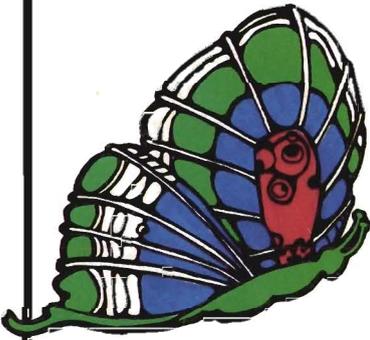

How to get Hundreds of Free Programs for the VIC-20 and Commodore 64

HAVE A PICNIC WITH THE VIC-NIC

The **Word Processor** designed especially for your **VIC-20**.

Output Files *compatible* with:

Word Pro
Superscript
Silicon Office
Word Craft
Paperclip
Final Word
...and many others

Features

wordwrap—
two story areas
all expected commands such as insert, delete, move
text, save, recall, etc.

Relocatable

written in machine language

Flexible

will work **automatically** on any size VIC

Fast

files created on the VIC-NIC maybe processed on
many other word processors

Compatible

works with either tape or disk

Unbelievable! But for \$19.50 there will be sent to you a tape or 4040 format disk (designate which you want or tape will be sent) that includes both the standard tape version and the expanded tape/disk version and instructions (both on the tape or disk and in printed form).

The system is designed so that you can use many of the popular existing word processors for output, or you can use the written in BASIC (so you can modify it if you have a special printer) printing/output program that will be included on your tape or disk.

ONLY \$ **19.50**

Cash, Cheque or Money Order to:

TYPE THRIFT

**SHELBURNE, ONTARIO
CANADA L0N 1S0**

EDITORIAL

VIC-20 VOTED

COMPUTER OF THE YEAR

VANCOUVER -- An international competition run by seven personal computer magazines has recently voted the Commodore VIC-20 "Home Computer of the Year. Judging was held in London, England.

The magazines sponsoring the competition were 'Databus' (Holland), 'Microsystems' (France), 'Bit' (Italy), 'Practical Computing' (England), 'Chip' (Spain), 'Personal Computing' (U.S.A.) and 'Chip' (Germany).

Computers had to meet basic criteria -- they had to be fully developed machines, not pre-production prototypes, and available to the market place with software and service back-up. Second and third places went to the Sinclair ZX81 and Spectrum, with the Atari 400 and Tandy Colour Computer coming in as runners-up.

New Regular

Contributors to the TORPET

In addition to the regularly appearing Butterfield Box we are most happy to announce some additional new regular features.

The Houston Hardware Hacker will soon be appearing, thanks to Hank Mroczkowski.

Bytes, which first appears in this issue, comes from Patrick Corrigan of The Toronto Star.

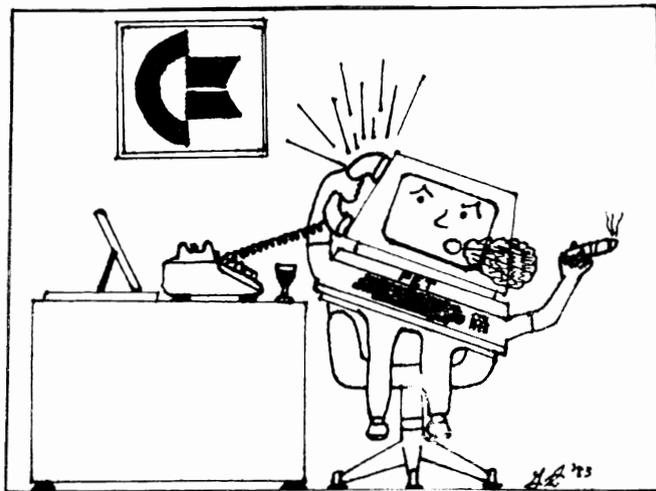

TidBytes, also appearing for the first time is from a sixteen year old TPUG member Glenn Anderson of Islington, On.

Mike Richardson is a Grade 12 TPUG member from Orangeville and his first contributions are found on several pages throughout this issue.

Our new punster is John Ylimaki from Nipigon, Ontario

TidBytes

by Glenn Anderson

"So, tell me, has being voted 'Man of the Year' by TIME had any affect on you?"

New Editorial Committee

The Torpet is most happy to announce that it has a new, and very distinguished in PETdom, honorary editorial committee.

Sphinx

It will be a few months before the committee's new policies (whatever they may be) can be reflected in the publication, but please continue to bear with us during our growing pains.

EDITORIAL

A Word of Warning

The Torpet is not the Good House-keeping of computers. Neither are we a Consumers Guide. We neither give a seal of approval nor do we rate the products. The products reviewed in our columns have not been independently tested or independently reviewed by us.

As many manufacturers and distributors of word processors, for the Commodore products, as we could find were invited to submit reviews. Not all of them arrived in time for this issue and more reviews will be printed in subsequent issues.

We try to print balanced reviews when they are available but often the reviews are by either the manufacturer themselves or someone commissioned by them. The reviewer may, or may not, be independently critical, or for that matter, may or may not be qualified to be doing the review.

The very fact that a review says some negative things about a product does not mean that the review is all that independent. Some commissioned reviewers are pretty shrewd.

We don't want you to think we don't love our reviewers, because we do. We greatly appreciate the person who takes the time to send us a review, pro or con. And, by the way, we pay \$20 per page for reviews, just like anything else. So, if you disagree with a review, whip out your word processor (or quill, if that is all you have) and send us yours.

The whole point is, take anything you read here (or elsewhere) with a grain of salt. In fact we take two.

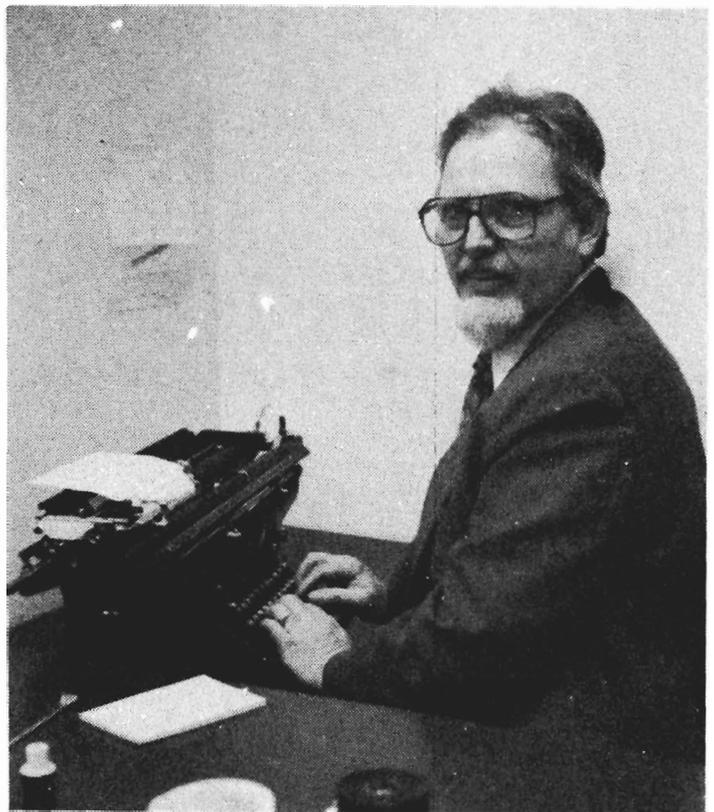

Photo: Graham Bailey

Ye olde editor, Bruce Beach, with ye olde word processor. We gotta be kidding. And believe me, we are. We would never get the TORPET out without a word processor. But we still use Susie Bell there to do a quick label or some other useful task.

The LONE RANGER would be a natural for TORPET's "Man of the Year"!

- His Indian companion is named TORONTO
- His PROGRAM is still in reRUNs
- He upholds the CODE of the west..by capturing BAUD guys
- He has silver BULLETINS on his BULLETIN BOARD system?
- He is very good at GARBAGE collection. As RipTaylor puts it, he is always riding DATA way
To the DUMP, to the dump, to the
dump.dump.dump
- I/O SILVER

a Ylimaki

What Is A Word Processor

by Bruce Beach

Word processing is the ability to electronically manipulate text without having to retype the entire document. This is one of the most popular uses for microcomputers.

You may do your editing of the text right on the screen of the computer or the word processor may allow you to print out a draft copy of a document. After examining the printout for errors you can enter your corrections and have the corrected document retyped or typeset with all the corrections in place.

This ability is very useful for documents that have to be repeatedly revised, such as catalogs, price lists, membership lists, club by-laws, contracts, essays, theses and dissertations. For things like catalogs it is possible to retain the electronic files from year to year and then just make the updates as necessary before each new reprinting.

Corrections can include new margins, spelling, deletion of paragraphs, insertion of paragraphs, or the movement of a paragraph from one place to another. Text can be manipulated in almost anyway conceivable.

The quality of the output is as much dependent upon the output device as upon the word processing program. The control of the output device is usually accomplished by putting 'markup' into the text. The markup can be quite simple or quite complicated depending upon the capabilities of the output device. Many word processors are capable of putting in markup for any number of output devices, such as a variety of printers or typesetters.

It is really most convenient to distinguish between the text editing or input function of a word processor and its output or printing

function. Some word processors divide the functions into two distinct and separate programs.

Good questions to ask when considering the text editing or input function are:

1.) Is there word wrap? This means that the word is automatically moved to the next line when a word will not fit on the line where it is being typed. It makes the text much easier to read and speeds up the use. However, some word processors do not include it because it also uses more of the text memory.

2.) How does one see the text displayed? Is it formatted on the screen in the same manner as it will be output? Narrow screens do not usually allow this to be done very conveniently. This may or may not be a real consideration, especially if the output program is sufficiently sophisticated to automatically handle hyphenation and justification of the text.

3.) Most important is the ability of the operator to easily enter the text. Therefore, are commands to copy, erase, or move text easily given, or does one have to use such things as delimiters and some combination of commands?

Good questions to ask when considering the text printing or output function are:

1.) How complicated is the markup? This may not be a consideration if the markup is done by someone other than the person doing the input. For example the text may be input on one word processor and marked up for output on another.

2.) How easily can the files be linked

FEATURE

for output. Again this may be only a consideration in the output word processor.

3.) With what output devices (or for that matter with what output word processors) is the word processor compatible.

4.) Is the word processor capable of controlling all the output capabilities of the output device?

Summary

In summary then it may just be necessary for an input word processor to take 'idiot' type. That is where the operator does

not even have to worry about line endings or carriage returns. It may or may not be necessary for the input word processor to have strong editing capabilities.

Conversely, if all of the editing is done before the text reaches the output word processor then that word processor may not need strong editing capabilities. Markup can be put in by either processor depending upon the system design.

Quite often all the input and output functions are found in one word processing program. Such overall programs usually do both functions less well than the specialized input or output programs.

Checklist for Choosing a Word Processor

by Bruce Beach

Number one Easy to learn

A big fancy word processor may have so many commands in it that you will never figure out which are the commands you really need, since most of them are commands you will never use. Don't judge how good a word processor is by the size of its instruction manual.

The faster you get going the more certain you are to find your word processor useful and to fall in love with word processing. You should be able to really get going on a simple word processor within 30 minutes and be able to master it within a couple of hours.

There are some manufacturers with word processors so complicated that they offer a course a couple of weeks long on its use. Do you want to need that? Probably not.

Number two Easy to use.

This is different from easy to learn and

it is probably the biggest, most important, and most subtle difference between word processors. Again more expensive does not necessarily mean easier to use. In fact it often times is quite the opposite. You will have to learn to judge this matter for yourself, or at the outset go by a critical review.

Number three Cheap

For some people money is not a consideration. Cost may not be important to you at all, but it is to me. However, since you may end up buying more than one word processor, as you come to know about them, then why not first get your feet wet as cheaply as possible?

Number four Will it do the job?

I would have put this as number three but that is again part of the problem. Until you have had some experience you probably

FEATURE

will have some difficulty in defining just what is the job you want it to do.

Number five Compatibility

By that I mean that I want the output files from my word processor to be able to be loaded into some other make. Now you might not consider that as being important at all. But, I would consider it as being very important. Do you want to be able to send your tapes or disks to someone else to have them printed, or typeset? Maybe, you would like to write some articles for *The TORPET*. That would be really nice, and it would be nice if you could submit them in a machine readable form.

Number six Transportability

That is to be able to move from from one computer to another. You can buy word processors that are built into the machine. Ugh. To change word processors you have to change machines.

More often, and this is just about as bad, the word processor you buy will work only on one machine. If you have a VIC and you get a Commodore 64 then that usually means you have to get a new word processor.

Some are even worse than that. If you upgrade from a 40 column CBM to an 80 Column, or even from 16K to 32K it can mean that your old word processor no longer works. Or your word processor may only work with one printer. Anyway, I think you should watch out for this one.

Number seven Reliability

This one is especially important if you are putting a lot of money into it. Is the company behind it a big one that is going to be around to support changes such as made by Commodore in their ROM sets, or compatibility with new disk drives, or new printers that come on the market?

Number eight Convenience

You might think with "easy to use" and "easy to learn" and the other things on this check list that we had already covered convenience. But we haven't. To learn about inconvenience wait until you get a word processor that requires a special ROM to be installed in your computer. Then later you may find and buy still other programs that want that same ROM spot. Plug and unplug. Plug and unplug. Ugh and Ugh again.

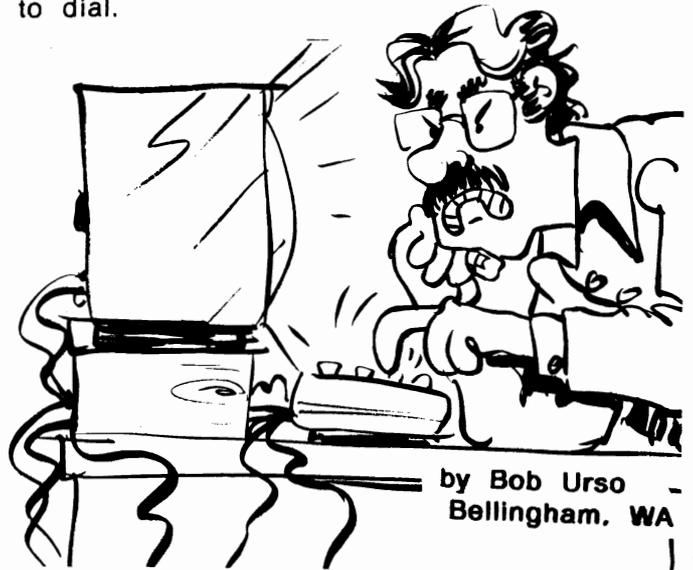

There could also be special cable arrangements required, or other things that can be just as inconvenient. Think about it.

Number nine Output quality, and flexibility

Surprise! I would not recommend that at the outset that you look for too much. Just make sure that it does what you really need it to do. The more bells and whistles that you get -- once again the more complicated it may be to learn, and mean the less real use that you will get out of it.

Summary

Well, there was my check list. You will have to make up your own. But golly, do learn to use a word processor. Living in a world where we have them and still not being able to use one is like living in a world with telephones and not knowing how to dial.

by Bob Urso
Bellingham, WA

The BEST Word Processor

by Ed Mansfield

Question: How does one determine which is the best word processor?

Answer: In the same way one determines which is the best vehicle.

First: You have to ask the question best for what?

Suppose you were trying to choose a vehicle. Tell me, which is the best. A small sports car? A farm tractor? Or a truck? A small sports car is great for going down the highway at a fast speed. It is economical to run, and it may be fun. But it sure wouldn't do very well at pulling a plow in the field.

On the other hand, a tractor would do great in the field, but it surely would be slow going down the highway. Likewise, while a truck is very useful for hauling big loads quickly down the highway, it does use an awful lot of gas.

We could give many more examples of specialized vehicles. From the family station wagon to the camping van, each is better for its own purpose. There is no way to build one vehicle that will do **everything** best.

The same is true of word processors. One might at first think that one program in one general purpose computer could be made to do everything. But, it just isn't possible. Functions require code, and code takes memory, and the memory of all our computers is limited.

Just having more memory isn't the solution either, because a very large program might take more time to operate and therefore be less efficient. More importantly, if it is designed to do one thing well, that very design may preclude it from doing another thing well.

Is choosing a word processor very complicated then?

No, not really. You just have to know what you are looking for. First of all it has to work on **your** computer. Therefore, if you have a VIC you don't have to look at Commodore 64, or PET/CBM word processors. If you haven't chosen a computer yet then of course you can know at the outset that the larger the computer you get the larger the word processor you can run.

However, again, larger still does not necessarily mean better, (especially for you). In choosing a computer you have to know what you want, and need, and should get, just in the same way as in choosing a vehicle or word processor.

Getting your first word processor.

But, let us assume you have a computer, but don't have a word processor. Further, let us assume that you have never had a word processor. What then should you be looking for?

To begin with, get something cheap. I think the cheaper the better. Maybe, even free. There are free word processors on the TPUG club library. You can't start much cheaper than that.

First, just get any old word processor and learn to use that. Learning to use a word processor is a lot like learning to program (although it is not nearly so difficult). The way that it is a lot like learning to program is that you will spend 90% of your effort in learning to use the first one, and 10% of that amount of effort in learning to use the second. Or, as another example, it is a lot like learning to drive a car. Once

FEATURE

you learn to drive one it doesn't take nearly so much effort to learn to drive a different one.

Admittedly, some of the free word processors are not so hot. That is why they are free. They can't be sold, so they have to be given away. But, I will tell you a secret. Some of the more expensive word processors aren't so hot either. Once you have learned to use one word processor you can begin to appreciate the features in another.

The biggest mistake people often make.

That is to have used just one word processor. They think that because of the difficulty they had in getting used to the first one they would have to go through that to learn a second. And so, without every really becoming familiar with a second one, they go around defending their first one.

Secondly: I highly recommend that after you learn to use one word processor you make a decided effort to learn a second, and a third. Now, you will really be able to compare features.

Some word processors are best for writing letters. A lawyer, or business man that writes many similar letters will find this type of word processor most useful. It will automatically replace certain spots in the

same form letter with another person's name, and other particulars, such as amount of money owed, and so forth.

Another kind of word processor may be excellent for a firm that has long lists of clients, such as a fund raiser, or someone who does bulk mailings. It may work very well with large external data files.

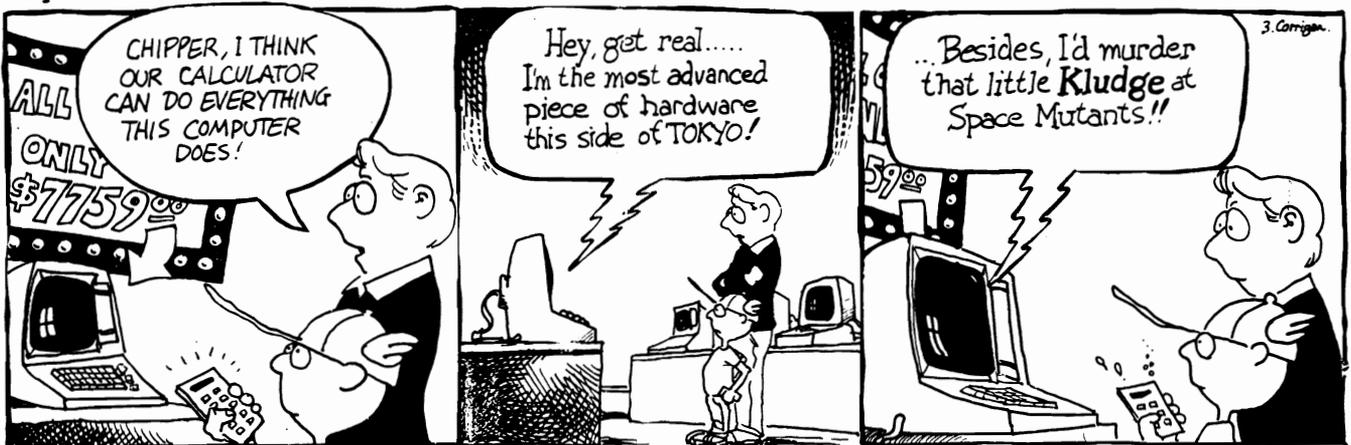

Still another word processor may be most excellent for the author or writer (school teachers and graduate students most usually fall into this category). This kind of word processor is very good at allowing one to move around text, rearrange it, merge it, and generally keep track of it.

Each of these types of word processors will have a number of special features that are of particular use to the application for which they were primarily designed. Each of them can also do most of the functions that the other can do. Probably not as efficiently, however.

This is where we get into our difficulty. Every manufacturer will tell you that his is the best (at least for the money) and that it will do everything (it most likely will) and some things superbly (and that is most likely true too). But, will it do superbly what you want it to do? That is the question, or better yet, the question should be, "What do you want?", or perhaps even, "Do you know what you want?"

All The Reasons You Shouldn't Get A Word Processor

by Ed Mansfield

Do I really need a word processor?

Are you a student in school where you have to write essays?

Are you a business or salesperson who has to write a lot of reports or letters?

Are you a person with a large correspondence to family or friends?

Are you a creative writer much of the time, or even someone who wants to write that family history or famous first novel?

If the answer to any of these questions is "yes" then you need a word processor.

But, aren't word processors expensive?

Not, if you already own a personal com-

FEATURE

puter. If you don't already have a computer it may be the very thing that justifies your getting one.

Even if I have a computer it would mean I would have to get a printer and a lot of other expensive equipment.

Not necessarily. If you are a student you may be able to write your essays at home on your own computer and then take them to school to use your school's printer to print them out.

Or, if you are a business person, you could create your reports at home and print them out on the computer at work.

Or, if you are a creative writer, you can type in your manuscript at home and then send your tapes of disks to a firm that does typesetting for them to process them. This can really reduce your costs.

It still sounds kind of expensive.

For less than \$400 today you can buy a VIC, a tape drive, and a word processing program. The whole works for less than \$400 where just three or four years ago a word processor alone would have cost you thousands of dollars. It costs really peanuts today if you already own a computer.

Well, it sounds complicated.

It doesn't need to be. You can find some word processors that you can learn to use in just a couple of hours. And once you learn, if you do any writing at all, you will find that it saves you hours upon hours of effort and allows you to do a much better job.

But, I don't even know how to type. Or at least, I don't type very well.

That is just why you need a word processor. It does for a poor typist what a calculator does for a person who is poor at adding up numbers. It quickly gives you accurate results. Your papers can look just like they have been typed by a professional. Everything in the right place and no erasures.

A word processor might make papers neater but I don't see how it could make them better.

Well, it almost always does. Because of the ease with which ideas may be moved around, inserted, changed or deleted, the end result is usually much better. It is also so much easier to do rewrites and correct the grammar.

It probably still wouldn't be that much help in doing school or business home work.

Want to bet? If you're graded on performance, then with a word processor it is a lot easier to perform. The word processor lets you do away with the mechanics of writing and instead concentrate on the creativeness. Many people (and especially young students who didn't like to write before) suddenly find that it is enjoyable to be creative. The reason? Those messy old mistakes that used to be so hard to correct are now a breeze and, after an editing, the results are something of which one can be proud.

So, what for are you waiting? Try one. You will probably like it. "I really cannot tell you how good an apple tastes, if you have never tried one", he said. Heh, heh, heh.

GENERAL

The Limitations of Tape Word Processing

by Gary Greenberg

N·Y· N·Y·

When my writing was limited to just letters and magazine articles of only a few pages, I found that storing my word processor output on a cassette tape was adequate for my purposes. However, when I received a contract to write a book, I soon found a cassette thoroughly inadequate and after about thirty pages into the book I gave up on the cassette and decided that I needed a disk drive for storage.

The distinction between cassette and disk arises from the fact that word processing stores the text as a series of files. A cassette drive can only access files in a serial format. That means that the computer has to read each file one at a time until it comes to the one you want.

The files must also be stored in the order in which they are to be printed because the cassette drive reads the files only in one direction. Consequently, in order to correct a file, you must store it on a new cassette, transfer all the preceding files to a third cassette, add the corrected file to the third cassette, and follow that by adding the files that come after the corrected file. Because of how slowly the cassette drive transfers data, the process for making corrections in the text gets to be very lengthy and confusing.

With a disk drive setup, you can store the files in any order and call up any file as rapidly as any other file, no matter its location on the disk. This greatly simplifies the correction process.

A SECOND OPINION ABOUT TAPE

While everyone will admit that disk is more convenient, tape does have certain advantages.

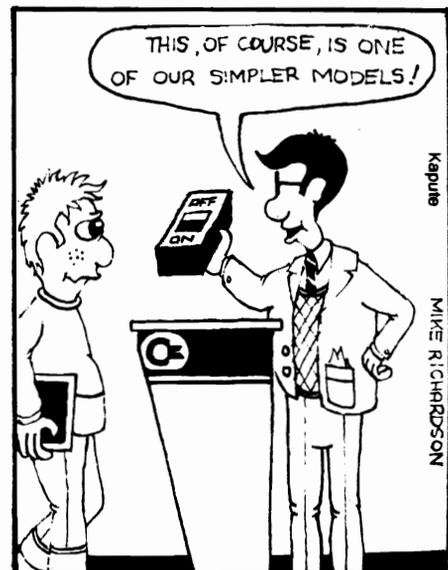

Number one. It is cheap. A tape drive can be less than \$100 and a disk drive may cost several hundred or over a thousand dollars. And the diskettes themselves are more expensive than tape cassettes.

Number two. Tape can be used much more randomly than some people realize. Since the tape cassettes themselves are so cheap (as little as 3 for a dollar) all you have to do is buy lots of them and store just one file on each tape. Then you can pick them out of your file drawer randomly.

Number three. Tape is perhaps the more economical way for mailing if you are going to be sending your input to someone else for processing.

Number four. And most importantly if you are using one particular machine mostly for input and will do the editing elsewhere then tape is most definitely the most economical way to go.

So don't write off tape, even for large jobs, it can have its place.

The VIC-NIC

by Bruce Beach

This is a description of the VIC-NIC word processor designed by Bruce Beach and programmed by Gottfried Walter. It is compatible with the FINAL WORD, Wordpro, Paperclip, and many other wordprocessors. VIC-NIC created text files may be output through any of these wordprocessors or through a simple 'written in BASIC' routine that you may modify to be compatible with your printer.

VIC-NIC has a number of interesting capabilities that are unexpected in a word processor that will work on a standard size VIC with ONLY a tape drive. For example, word/wrap, two work areas, and relocatability to any size of memory.

There is an expanded version of VIC-NIC that works with BOTH tape and disk. The expanded version also automatically relocates to any size of memory. In addition it also has the ability to display the disk directory, and two function keys (f3 for screen up and f5 for screen down) not available in the standard version.

The features common to both versions of VIC-NIC are as follows:

[f1] - top of text
[f7] - bottom of text

[COMMODORE key] simultaneously with:

- i - insert line
- d - delete line
- r - restart
- f - flip area
- p - pack
- u - unpack
- m - memorize
- b - bring back
- s - save area
- l - load area
- q - quit

All the cursor keys work as normally.

Shift spaces are format spaces which will not be deleted by the pack routine.

The return key inserts the back arrow which usually indicates the end of a paragraph and the beginning of a new line for most of the the compatible wordprocessors.

There is automatic word wrap and line insertion when typing. The line insertion command is available, however, if you wish to use it.

The line deletion command is very useful for repeated use in clearing text from the current cursor location to the bottom of the text area.

Restart goes to the beginning of the current text area and clears it so you can start over.

You have two text areas. To flip from one to the other you simultaneously press the [COMMODORE key] and 'f'.

Pack removes all extra spaces from the text area that you are currently using. This can be used to put more text into a small text area.

Unpack goes through and reformats the text area (ie. word wraps it) so that it is easier to read. (It is not necessary to first pack the area because unpack automatically does it.)

Memorize is used for copying passages of text not longer than 192 characters. To copy, press the [COMMODORE key] and 'm' - simultaneously. Continue to simultaneously hold down both keys until all the text you desire to memorize has been reversed.

VIC

(Press RETURN when you are through defining the text you wish to be memorized).

To bring back the memorized text first move the cursor to where you wish to place the memorized copy and then simultaneously press the [COMMODORE key] and 'b'.

You may bring back a memorized passage as often as you wish. One or two extra lines of spaces may be automatically inserted after the text when it is brought back. These extra spaces can be removed at some convenient time by using the unpack command.

You can copy from text area 1 to text area 2 (and vice versa), if you wish.

Any formatting commands acceptable with other systems are permitted. Special characters are obtained by striking the appropriate graphics key simultaneously with the [COMMODORE key]. The shift at sign is the control check mark (✓). Consult the relevant word processor' manuals for its standards.

Extended versions are available for VICs that have expanded memory.

Expanded memory of course provides much more text area.

Extended versions work with both tape and disk:

[COMMODORE key] plus 'english pound' sign will bring the disk catalog into whichever text area you request it.

[drive 0 is the default drive and is what you get when you press RETURN in response to the prompt]

[otherwise designate the drive].

Extended versions also have additional features such as:

[f3] page up
[f5] page down
[home] top of page
[clr] bottom of page

(Future versions and a version for the 64 may have hunt and replace commands and enhanced memorize and erase commands.)

When loading from or saving to disk it is advisable that you use a drive number (ie. '1:filename').

If you wish to replace on disk you simply do this : '[at sign]drive number:file name'.

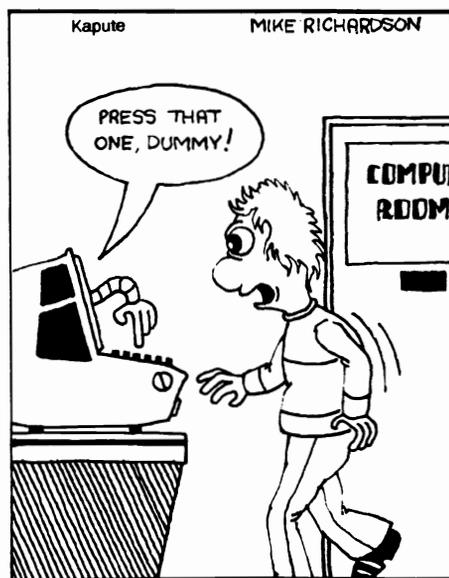

When saving on tape you can't have an [at sign] in the text file because the computer thinks it is an 'end of file' marker. (It is all right with disks though and is used for replacing a file).

For tape operations a file name is permitted but not necessary.

Prompts and error messages appear on the second line of the screen below the area and line indicator.

The line indicator is useful in indicating how much space you have left in the text area.

To quit VIC-NIC either use the Quit command or turn off your VIC. Do NOT use shift run/stop restore. Some BASIC pointers have been changed. Before quitting (or restarting a text area) be sure you have first saved any text files that you wish to keep.

VIC

Ask Dennis

A VIC Tip

by Dennis McCormack

If you have a question about your VIC or computers in general, just write it down and send it to Dennis McCormack c/o VNN Box 981 Salem, NH 03079.

Q. How do you program the special function keys?

A. Without purchasing a 3K expander or Programmers Aid Cartridge, you can program these keys in simple BASIC as follows:

```
[For F1] IF PEEK(197)=39
        AND PEEK(653)=0 THEN***
[For F2] IF PEEK(197)=39
        AND PEEK(653)=1 THEN***
[For F3] IF PEEK(197)=47
        AND PEEK(653)=0 THEN***
```

```
[For F4] IF PEEK(197)=47
        AND PEEK(653)=1 THEN***
[For F5] IF PEEK(197)=55
        AND PEEK(653)=0 THEN***
[For F6] IF PEEK(197)=55
        AND PEEK(653)=1 THEN***
[For F7] IF PEEK(197)=63
        AND PEEK(653)=0 THEN***
[For F8] IF PEEK(197)=63
        AND PEEK(653)=1 THEN***
```

The *** refers to the action you want to happen. It can be a print statement, a GOTO, GOSUB or any other BASIC command. Of course you should put these commands in a loop so they get recognized. Try this sample program:

```
10 IF PEEK(197)=39
    AND PEEK(653)=0 THEN PRINT"John"
20 IF PEEK(197)=39
    AND PEEK(653)=1 THEN PRINT "Loves"
30 IF PEEK(197)=47
    AND PEEK(653)=0 THEN PRINT "Mary"
40 GOTO10
```

MICRO WORLD ELECTRONIX

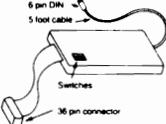

PROGRESSIVE PERIPHERALS & SOFTWARE

U.S. Distributors for:

MW-302
VIC-20/64 Parallel Printer Interface

Works with all centronics type parallel printers and plotters including:

- Epson

VIC and RS-232 Printer

by Daryl E. Williams

Santa Ana, Ca.

Am I the only VIC-20, RS-232 printer user? It seems that way, when it comes to getting information or buying software. When you do find anything in the RS-232 interface, it's on the modem only. It's time we stood up and be counted. Let's have a RS-232 information exchange on printers and disks. Write to me and let me know any of your experiences with the RS-232 interface. If there are enough, maybe we can start our own users group.

The reason I ended up with this problem is as follows. This guy I work with, had a rebuilt Data Products DP-50 daisy wheel printer for sale. Only \$250.00 but little did I know what was ahead. I bought a Quantum Data Model 1800 printer. Which is a RS-232 interface connected to the users port. Hey, this is great, now all I have to do is power up, and we are in business. W R O N G! My first problem, it didn't line feed. Everything printed on the same line. After many failures and much research, I found the answer. I had to use open 128,2 or greater. That was in May of 1982. Only you who have experienced this will know that wasn't the only problem. For you beginners heres a couple hints.

To list a program, use
OPEN 128,2,0,CHR\$(6):CMD128:LIST

Explanation: You must use greater than 127 for line feed, in this case 128. The 2 is the users port device. The CHR\$(6) prints in 300 baud.

To convert to standard ASCII subroutine

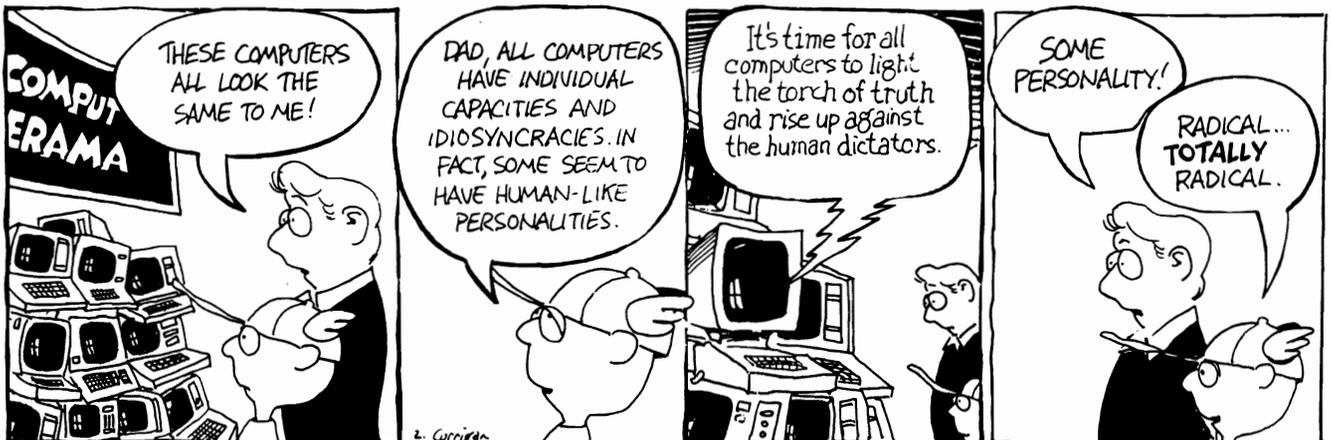

```
1000 REM Standard ASCII subroutine
1010 X=LEN(P$):IF X<1 THEN1060
1020 FOR I=1TOX:X$=LEFT$(P$,I-1):
      SS$=MID$(P$,I,1):Z$=RIGHT$(P$,X-I)
1030 Y=ASC(SS$):IF Y>64 AND Y<91 THEN
      SS$=CHR$(Y+32):GOTO1050
1040 IF Y>192ANDY<219THENS$=CHR$(Y-128)
1050 P$=X$+SS$+Z$:NEXT
1060 RETURN
```

Boy, would I like to have a way to change some of the VIC printer programs to print on my printer.

Write to me:
Daryl E. Williams

VIC

VICSCRIPT

A Word Processing Program

Reviewed by Marc Swanson

Toronto

VicScript is a word processing program for the Commodore VIC-20, written by David Foster and distributed by Richvale Telecommunications. It is an excellent word processor for anyone who already owns a VIC and wants to get the most out of their machine.

What I Liked

VicScript is both easily learned and easy to use. It is also a far more powerful word processor than might be expected with the VIC. The program's major functions, all shown on the menu line, are accessed with two keystrokes. Aside from the usual inserting and deleting of words and lines, VicScript has several strong editing features, such as insert mode and delete mode. Formatting instructions for printouts, such as pitch, margins and line length, are not embedded in the word processing text, but contained in a separate part of the program called a Control Map. They are easily altered or can be left on default settings.

The limited memory of the VIC is easily its biggest drawback for serious microcomputer work. VicScript goes a long way toward solving this problem. The program is installed on ROM chips and placed in one of Commodore's memory expander cartridges for the VIC, where it operates like a cartridge video game. If you buy VicScript on a 16K expander cartridge, the program itself takes up no memory and you have the VIC's 5K plus the 16K in the cartridge to store word processing data.

VicScript saves data to tape or disk, or both. This makes it an economical starting word processor for the tape user who wants

someday to graduate to disk.

Other features include underlining and bold print, both easily accessed from edit mode. Text and background colors can be changed for greater legibility. Disk users can use VicScript's index to record names of documents and their locations on the disk.

What I Did Not Like

The limitations of VicScript are the limitations of the VIC itself. The 22-column display is irritating to an 80-column user. VicScript has no video print, which can sometimes make printing a hit-and-miss affair. Options available with word processors on more powerful computers, such as global search and replace, are not available with VicScript. The problem of the VIC's limited RAM is only partially solved by placing the program in ROM. The amount of word processing data in memory is severely limited.

Summary

VicScript gets the most possible from the VIC-20. It is an excellent value for VIC owners who want an uncomplicated but fairly sophisticated word processor. However, VicScript is not a reason to rush out and buy a VIC. For business or serious writing, I would not recommend VicScript, not because of VicScript's limitations, but because the Commodore VIC-20 is not the computer for serious writing.

VicScript is available from Richvale Telecommunications at \$100.00 over the retail price of the RAM cartridge on which it is installed.

Bulletin Board Update by Richard Bradley

Well, I tried to make the last published list of BBS NUMBERS as up to date as possible, but that didn't seem to help me. So now I will again try to straighten the list out.

Much to my delight we have not had any BBS deaths, so we can get right into the BBSs that have moved.

The Toronto Heathkit Users Group (THUG) really seems to be playing a game of musical BBS. They have again moved the system. I have no reports as to why they have done it again, but the number has changed from 231-4174 to 232-2644.

Toronto Net-Works 2 has not actually moved, but the Net-Works computer club decided to allow the number to be published. This is of really no help, because you can't use the Net-Works 2 unless you have paid your \$15.00 to Net-Works 1. For what it is worth, the number is 494-7577.

OSBOARD operated by that wonderful fellow Simon Ewins has not actually moved. It is in the exact same location, but a new phone line was installed to allow the system to run 24 hours a day. The new number for this system is 626-1247.

That seems to be all the moving systems taken care of, so now we will move on to the new systems.

A BBS has been set up for the computer user interested in medicine. It operates from somewhere at the University of Toronto. The system is run by a professor from some part of the medical faculty. The name of this BBS is the Toronto Medical Net-Works. It is APPLE based, and is very similar to the Toronto Net-Works BBSs, but it has been pointed out that no affiliation between the two systems exists. The number of the BBS is 978-6893.

Another new BBS is now in the testing stages. It is called Torontari. I don't know much about this system other than they are testing it. The number for it is 694-4163.

This is really a move, but the system was not in Toronto, so we will call it a birth. This BBS used to run in Vancouver B.C., but for some reason the SYSOP moved to Toronto. He was nice enough to bring his BBS with him, and has set up for public access. The BBS is called CBBS, and the number is 596-0283.

Here is the new list of BBS numbers:

Area Code Is (416) Unless Specified

NORTEC BBS *	-----	487-2593
PSI-WordPro *	-----	624-5431
TPUG *	-----	223-2625
R.T.C. BBS *	-----	884-6198
Atari Info-System	-----	622-2462
Apple-Can	-----	447-8458
ETI BULL BBS	-----	423-3265
Infoport	-----	278-3267
Toronto Net-Works1	-----	445-6696
Toronto Net-Works2	-----	494-7577
THUG	-----	232-2644
RCPM1	-----	231-9538
RCPM2	-----	231-1262
IBMPC BBS	-----	499-7023
CSE	-----	236-1512
OSBOARD	-----	626-1247
Torontari (UNDER TESTING)	-----	694-4163
Toronto Medical Net-Works	-----	978-6893
CBBS	-----	596-0283

(* = PET Based Systems)

I would like to assemble a North American BBS listing to publish once a year, so if you could send me any BBS numbers, their hours, and their city it would be much appreciated. Send all of them to:

147 Roe Ave.
Toronto, Ontario
M5M 2H8
CANADA

The TPUG Conference

by Gord Campbell

Plans for the TPUG Conference are moving toward their final form. The Conference will be May 14 and 15, at the Casa Loma campus of George Brown College.

Topics planned for presentation at the Conference include:

- BASIC file handling
- formatting in BASIC
- using relative files
- games review panel
- financial modelling
- introduction to word processing
- advanced word processing
- using the bulletin boards
- other languages
- BASIC extensions in the B series
- using assemblers
- designing a command recognizer
- hardware interfacing
- music with the SID chip
- PASCAL
- computers in the church
- computers in small cancer clinics
- file handling in machine language

Hopefully, the next issue of the TORPET will include a schedule, so you can plan to attend those sessions which are of most interest to you.

Approximately 50 commercial organizations have been contacted regarding exhibiting at the conference. The ones who exhibit will be selling their wares, so don't forget to bring your credit cards.

With the identification of library managers now completed, we expect to be well prepared for the copy session. Not all of the library will be available, since that would require an unmanageable number of disks, but the intent is to offer all of the good stuff. We need more equipment to make the copy session a reality, so please call Bill O'Brien at 445-0331 or Gord Campbell at 492-9518 if you can loan out a 4040 and something to control it for the weekend.

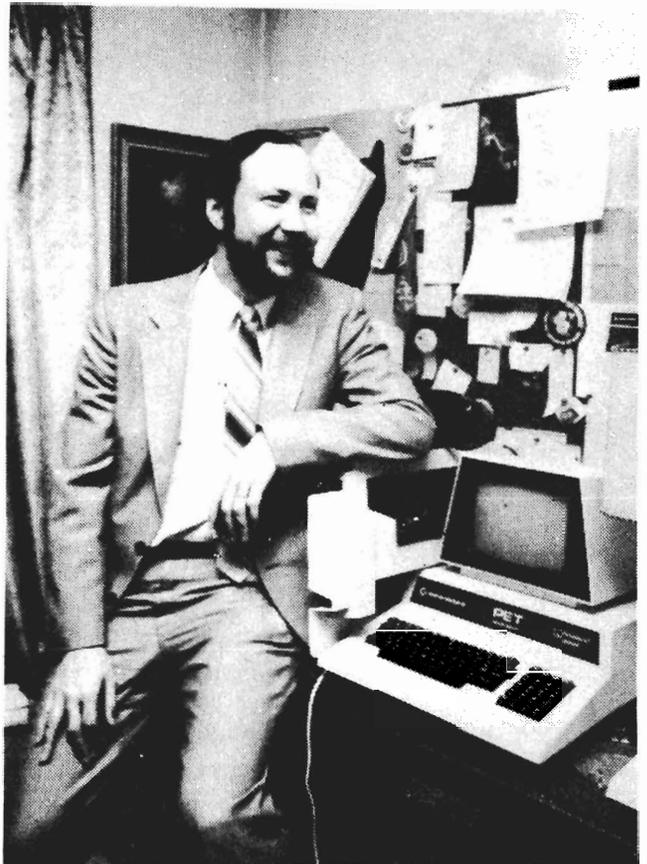

Photo: Graham Bailey

The College cafeteria will be open on the weekend, providing a place for refuelling and discussion. The Introduction to Machine-language Seminar has been filled. The Traders Corner is expected to be a popular place to sell that redundant equipment or pick up a bargain, depending on your point of view. (Kids, tell dad that this is his chance to pick up a computer for HIM to use.)

The people who have helped bring the conference to this stage are:

Rosemary Beasley
Jim Carswell
Keith Falkner
Al Farquarson
Terry Herkenrath
Mike Hyszka
Rob Lockwood
Bill O'Brien
John Shepherd
David Williams

Many thanks are due to all of them for their efforts.

Now the VIC 20 and 64 can communicate with PET peripherals

ACCEPTS ALL COMMODORE IEEE-488 AND SERIAL IEEE PLUS RS232 DEVICES

ALL 3 BUSES MAY BE USED SIMULTANEOUSLY AND THE SELECTION PROCESS IS COMPLETELY INVISIBLE TO THE CONTROLLING COMPUTER.

Would you like to be able to access **any** of these peripherals from your computer?

- 1/3 megabyte disks (Commodore 4040 drive)
- 1 megabyte disks (Commodore 8050 drive)
- 10 megabyte disks (Commodore 9090 hard disk)
- Printers including a wide range of inexpensive IEEE and RS232 matrix and quality printers
- IEEE instruments such as volt meters, plotters etc.

Now you are no longer limited by the VIC or the 64's serial bus. Simply by attaching INTERPOD you can vastly increase the power of your VIC 20 and when used with the new 64, INTERPOD turns the computer into a really powerful system.

With INTERPOD the VIC and 64 become capable of running really professional quality software such as Word-processing, Accounting, Instrument control and many more.

INTERPOD will work with any software. No extra commands are required and INTERPOD does not affect your computer in any way.

Using INTERPOD is as easy as this:

Simply plug INTERPOD into the serial port of your computer, power-up and you are ready to communicate with any number of parallel and serial IEEE devices and any RS232 printer.

TPUG

(Toronto PET Users Group)

Information and April/83 Library List

Membership Fees

The fees, which pay for 12 months from the time of joining, have been set as follows:

- \$30 - Regular Member
- \$20 - Student Member
- \$20 - Associate Member
- \$30 - Associate Member overseas

A Regular member is one who attends meetings regularly in the Toronto area and is the only type of member with voting privileges at the annual meeting. A Student member is someone who attends meetings and is a full time student at a public or high school, a community college or a university.

Associate members are those people, who because of distance or time restrictions, are not able to attend the regular meetings. Fees are in U.S. funds except in Canada where they are in Canadian funds.

All members receive ten issues of the TORPET annually. The TORPET (an independent Commodore magazine published by The Publisher) is the official magazine of the Toronto PET Users Group. Also, members have access to the club library of programs on disk and tape. There are several ways of obtaining these disks and tapes:

1. Take a blank disk to the club meetings and have that night's programs copied onto it.
2. Attend the yearly conference where club disks can be copied onto your blank disks.
3. Find a friend or dealer etc and copy their disks.
4. Join the Copy Tree (see page 3).
5. Order disks or tapes through the mail from the club office (see page 6).

TPUG Event Calendar

Central Chapter - Leaside H.S., 200 Hanna Rd. Bayview & Eglinton, at 7:30 pm. (PET/CBM/SuperPET)

- Wed. April 13, 1983
- Wed. June 8, 1983
- (There is no May meeting.)

Westside Chapter - Sheridan College, Trafalgar Rd, Oakville at 7:00 pm in cafeteria. (PET/CBM/VIC/C-64)

- Wed. April 20, 1983
- Wed. May 18, 1983
- Wed. June 15, 1983

VIC 20 CHAPTER - North York Library, 5125 Yonge St., N. of Sheppard at 7:30 pm in auditorium.

- Wed. April 6, 1983
- Wed. May 4, 1983
- Thu. June 2, 1983

Commodore 64 CHAPTER - Earl Haig S.S., Kenneth & Princess (6 Blocks North of Sheppard, 2 blocks East of Yonge) at 7:30 pm in auditorium.

- Tues. April 5, 1983
- Mon. May 16, 1983
- Tues. June 14, 1983

Machine Language CHAPTER (6502) - Call Jim Carswell at (416) 531-9909 for additional information.

TPUG Conference - George Brown College

May 14 and 15, 1983.

Business Meeting - Leaside H.S., 200 Hanna Rd., Bayview & Eglinton, at 7:30 pm.

Thursday April 7th

History of Commodore

Commodore currently has the widest product line of all microcomputer manufacturers. This was not always the case. In 1977, Commodore came out with a home computer called the PET 2001. PET stood for Personal Electronic Transactor and consisted of a very small calculator keyboard, a 9-inch screen and a built-in cassette drive all in one package. Also included were 8K of RAM and a 16K BASIC in ROM. This BASIC is now known as BASIC 1.0 or original ROM.

Commodore then released a large keyboard PET with an external cassette. Some small changes were made to the BASIC to fix bugs and allow a disk drive to be added. This BASIC is now known as upgrade ROM or BASIC 2.0 (BASIC 3.0 in some parts of the world).

The next Commodore was the CBM 8032, an 80 column business computer with BASIC 4.0 in 20K of ROM. This improved version had some extra disk commands added as well as an improved string collection routine (garbage collect). Along with the CBM 8032 came the CBM 4032 computer, a 40 column PET with BASIC 4.0 and a 9 inch screen. A little later, the 4032's arrived with a 12 inch screen (this is now called the FAT 40). There are subtle differences between the two versions of the 4032, mostly with programs that use machine language. The final release of this series is the SuperPET, an 8032 with an additional 6809 processor, 96K and five programming languages.

The VIC-20 was Commodore's entry into the mass marketing of home computers. With a 22 column screen and only 5K of memory, most of us didn't take it too seriously. However, now it is the largest selling computer in the world with over one million sold in 1982 and two million to be sold in 1983. This machine comes with BASIC 2.0 similar to the old 'upgrade' ROM PETs. This means no built in disk commands and the return of slow 'garbage collection'.

In 1982, Commodore introduced the Commodore 64 which, like the VIC-20 has BASIC 2.0, but comes with a full 64K of RAM. In February of 1983, Commodore started shipping the B500 and P500 series of computers which contain 128K of RAM and an extended BASIC 4.0.

The following is a list of the computers that Commodore has released:

PET	2001	(BASIC 1.0)
PET	2001	(BASIC 2.0)
CBM	8032	(BASIC 4.0)
CBM	4032	(BASIC 4.0)
CBM	4032	(BASIC 4.0 - FAT 40)

SuperPET	(8032 with a 6809 CPU)
8096	(8032 with 96K memory)
VIC-20	(BASIC 2.0)
C-64	(BASIC 2.0)
B-500	(BASIC 4.0 Ext - 80 Column)
P-500	(BASIC 4.0 Ext - 40 Column)

Programs that run on one machine do not necessarily run on another. Because of this fact, our library has been divided up into the following main categories:

VIC-20
Commodore 64
PET/CBM
SuperPET

If you wish to order disks from our library, please make sure that the programs you order are compatible with the machine you own.

Disk Identification

To divide the library by category we decided to organize all the disks according to a two character code placed in the disk ID. The first character is the category to which the disk belongs. The second character is a sequence number to separate all the disks in the same group. For example, E1 is Education disk number one, G9 is Games disk nine and GA is Games disk ten. All the disks described in this catalogue follow this convention except for the Commodore education disks. These disks have a three character disk ID (see - **Commodore Educational Disks/Tapes**). We are at this time settling on a new naming convention that will take into account the VIC 20, Commodore 64 and any other machines that may come onto the market. However, this will only apply to future releases of disks and not on the ones listed here.

The general groupings of disks are:

ID	GROUP	No. of DISKS
A	Assembler Source Code	5
B	Business	3
C	Communications	2
D	Misc. Commodore 64	3
E	TPUG Education	9
G	Games	11
K	Commodore Education	50
L	PET Language	2
N	Math / Science	3
S	PET Music	1
T	TPUG Monthly Releases	8
U	PET Utilities	7
V	VIC 20	8
X	TPUG Best of PET/CBM	7
Z	Miscellaneous	2

Please note that the majority of disks listed above are for the PET/CBM. With the large volume sales of VIC and Commodore 64 this year, this will change very quickly. On January 1st 1983, we had only three VIC disks. On March 1st 1983, we had 8 VIC disks with two more about to be released. In March 1983, we were working on setting up our first three Commodore 64 release disks to be released in April 1983. There are several SuperPET disks in preparation.

Types of Commodore Disks

Over the last few years, Commodore has released a number of disk drives for their wide variety of computers. These include the 2040, 4040, 2031, 8050, 1540, 1541, 8250, and 2031SL.

These drives can be divided into two major groups. One is the 35 track, 170K disk drive found in the 2040, 4040, 2031, 1540 and 1541. The second is the 77 track, 500K disk drive found in the 8050 and 8250.

The 8250 is a double sided version of the 8050. An 8050 disk can be read by an 8250 disk drive. Since the 8250 disk takes twice as long as the 8050 disk to create, we only send out 8050 disks in the 77 track format.

The 2040 disk drive is the original version available for the PET. It contained DOS version 1.0. The 4040 came out next with DOS 2.0 and used 6 less sectors than the 2040. This 4040 format is now the standard which we use in copying disks and can be read by the 2031, 1540, 1541 and 2031SL. However, it is possible that some of these single disk drives MAY not be able to write programs onto one of our disks because of a difference in timing. They should all be read compatible.

THE MONTHLY DISKS

At each meeting of TPUG there is a copy session so that members may acquire the programs demonstrated that evening by our speakers. Also included on that disk is a selection of programs submitted by members or received in the mail.

These monthly disks are coded with a 'T' designation as the disk ID. The Series from T1 through TJ covered meetings up to May 1982 and have now been retired and their contents merged into the appropriate category disks.

Tape/Disk of the Month Club

There are now three libraries that have monthly additions.

VIC-20
Commodore 64
PET/CBM

These may be copied free at club meetings or they may be obtained individually by ordering from the club office. To save the necessity of constantly having to order the current monthly disk distant members can order any number of months in advance and the disks/tapes will be sent automatically.

The request must include:

1. Whether tape or disk is desired.
2. Which library (VIC, C-64 or PET) is desired.
3. Sufficient payment for the number of disks or tapes ordered.

Rules of the Copy Tree

The copy tree assists TPUG in distributing disks by letting members do some of the distribution.

Participants in the copy tree must:

1. be a members of TPUG;
2. let their name be listed on the tree;
3. let two other people copy from you as new branches;
4. maintain complete library by ordering new diskettes from club office.

For more information about the copy tree contact:

Bonnar Beach
Horning's Mills
Ontario, Canada
L0N 1J0
(519) 925-5376

Commodore Educational disk/tapes

In September of 1982, TPUG received from Commodore Canada, a series of 642 Educational programs. These programs are contained on 50 diskettes and are identified, in our library, by a three character ID starting with the letter K. For example, Administration - KAA, Business - KBA & KBB etc.

These programs are a subset of those worked on by the school boards in the Metro Toronto area. Many of them are updated versions of programs already in our library. However, ALL these programs have been modified so that they will work on the following computers:

PET 2001 (BASIC 2.0)
PET 4000 (BASIC 2.0 or 4.0)
(9 and 12 inch screens)
CBM 8032 (uses CBM 4032 V2)
Commodore 64

The documentation for these programs can be ordered for \$2.00 (see ordering instructions).

Torpet back issues

Backissues of the TORPET are available for \$2.00 each from the club office (except for issues #1, #2, and #3 which are \$1.00 and issues #7 and #12 which are \$3.50). Our first issues are relatively small! Issues #1, #2, and #3 - 4 pages. Issue #4 - 8 pages and issue #5 has 16 pages. All the rest include at least 24 or more pages.

As of February 1983, there were 17 issues of the TORPET. New issues are mailed out on the 25th of the previous month. Therefore issue #18 will be sent on March 25th, #19 on April 25th etc.

Programs for the PET

The majority of the programs currently in the library will run on a 40 column PET. If you have read the HISTORY OF COMMODORE in this catalogue, you will note that there are four different versions of the PET. They are:

1. PET 2001 - BASIC 1.0, original ROM. This is the version of BASIC that came with the small keyboard PET in 1977.

2. PET 2001 - BASIC 2.0, upgrade ROM. The first large keyboard PET had BASIC 2.0 inside. The original PET could be upgraded to BASIC 2.0 by changing the ROM set.

3. CBM 4032 - BASIC 4.0. This version of the PET had a 9 inch screen with BASIC 4.0. Previous large keyboard machines can be upgraded to BASIC 4.0 from BASIC 2.0. The original small keyboard PET can not be upgraded to BASIC 4.0.

4. CBM 4032 - FAT 40, BASIC 4.0. This version of the PET has a 12 inch screen and a slightly different version of BASIC 4.0. This machine also has the same screen controller as the 8032.

Most of the programs in the library will work on all of the above machines. However, programs written in machine language or programs with PEEKs and POKEs to the operating system, will only run on the machine for which they are written. These special programs are divided into three groups. These are: BASIC 2, BASIC 4 and BASIC 4 (FAT 40). Most disks contain versions for each type of computer. The one exception is the BEST OF TPUG series (X). X3 is only for BASIC 2 machines. X4 is only for BASIC 4 machines. X7 is only for BASIC 4, FAT 40 machines.

Also, please note that the 'K' series of Commodore Education programs will all run on all BASIC 2.0 and 4.0 PETs.

Programs for the VIC-20

There are 10 disks/tapes specifically for the VIC 20 at this time. These are V1 through V8, TN and VTS. Also VIC programs can be found on each of the monthly disks. For example, the January/83 monthly release disk (TQ) contains a number of VIC programs mixed in with PET and C-64 programs. However, all VIC programs on these disks are included on VIC disks V1 to V8, TN and VTS. In March/83, we started releasing a monthly VIC disk to coincide with our new monthly VIC 20 meetings.

Note that some VIC programs require an 8K/16K/32K memory expander. Others, require the Super expander for the music and graphics commands.

Programs for the CBM 8032

Many of the programs in the TPUG library will run on the 8032. Some of the machine language programs, for example, are available in an 8032 version. These includes Basic Aid (BAID480A & BAID480P) on disk X1 and adventure on X5. Many of the games written for the 40 column PET can run on the 8032 but will require the 40 column simulator found on X1 (CBM 4032 V2.1). Just load in CBM 4032 V2.1 and RUN. You now will have a 40 column screen on your 8032.

Programs that will NOT run on the CBM 8032 include the following:

1. Many of the programs written in machine language.
2. Most VIC and Commodore 64 programs.

Some good choices of disks for the 8032 include:

B2, C1 or C2, G7, N1-N3, X1, X2, X5, X6
OR Z1

Also, please note that the 'K' series of Commodore Education programs will all run on the 8032 since CBM 4032 V2.1 is included with each disk.

Programs for the Commodore 64

All 50 of the K-series, (see Commodore Educational disks/tapes), work on the 64. In addition, there are 4 disks/tapes specifically for the Commodore 64. These are D1, D2, D3 and D4. However, other C-64 programs can be found on the monthly release disks. The February/83 disk (TR) contains a number of programs for the Commodore 64 as do TP and TQ. Also, the Best of TPUG disk X5 will run on a C-64 equipped with a disk drive.

In a few more weeks, we will be releasing a number of additional disks just for the Commodore 64. While the C-64 has only been available for a few months, the program library is building quickly.

Programs for the Superpet & CBM 8096

If you own a CBM 8096 or a SuperPET, order disks designed for the CBM 8032. Two new disks, ST1 and ST2 have been released just for the SuperPET with more on their way.

How to submit Programs

Programs for the PET, CBM, VIC and Commodore 64 can be sent to us either on disk or tape. The disk/tape will be returned to you as long as you have enclosed your name and address. It is also a good idea to put your membership number directly on the tape or disk just in case we misplace the letter or envelope it came with.

Send all programs to:

TORONTO PET USERS GROUP
1912A Avenue Road, Suite #1,
Toronto, Ontario, Canada
M5M 4A1

Chris Bennett
TPUG
Business Manager

CLUB CHAPTERS

In response to the many requests from other users groups, we have set up a way in which other Commodore clubs can associate with TPUG. There are two ways in which a users group or club can do this.

The first is to take out an associate membership for the club at \$20 per year. In this case, the club will receive 1 issue of the Torpet each month and the club will have access to TPUG's library of over 3000 programs.

The second way, is to have a group join TPUG. If 15 or more people join at one time (covered by one cheque), the associate membership fee is only \$15 per person. Then a copy of Torpet will be mailed to each individual member who will also have individual access to the library. If 25 or more people join at one time, then we will supply the club one free monthly disk each month. This can be either the VIC 20 disk, the Commodore 64 disk or the PET/CBM disk. If 45 or more people join at the same time, then 2 free monthly disks are sent out. If 60 or more members are enrolled, then all 3 monthly disks are supplied. All disks are sent Air Mail for speedy service.

We hope that this group rate will enable other clubs to serve their members better. Many clubs are putting out their own newsletter. Each of these may have only one very good article written by a local member. If, on the other hand, these articles are also sent to the Torpet, all clubs who contribute will benefit with a wider variety of high quality articles. Torpet policy is that articles in the magazine are in the public domain and can be used by any other club for reprinting in their own publication.

Another advantage of TPUG is the centralized pooling of programs for all the Commodore machines. This will result in a much larger program library since many good programs are only distributed locally whereas the TPUG library is distributed all over the world.

The Whole PET Catalog

The most complete documentation currently available for the TPUG library is found in The Whole PET Catalog. This 312 page publication gives both disk by disk and alphabetic listings of the PET library.

It also gives, in a catagorized form, a reprinting of the Midnight Gazzette that appeared in The TORPET. Besides extensive reviews of programs it contains much useful information for new owners of computers.

There is probably no better aggregate collection of information available for new members. It is an opportunity for the new user to become familiar with information often only known to old time members who have gathered it over previous years. There is a large VIC section. Price \$10. Order from the Club office. (See ordering instructions).

TPUG SUSTAINING MEMBERS

Sustaining membership is open to those organizations who wish to support TPUG to a greater extent than through regular membership. The annual fee for sustaining members is \$100.00. In return, these organizations are listed in the TORPET.

The sustaining members are:

Questar International
Richvale Telecommunications
T. Eaton Co. Ltd.

ORDERING INFORMATION

DISKS

To order club disks by mail, just send \$10 for each 4040 / 2031 / 1540 / 1541 disk and \$12 for each 8050 / 8250 disk (payable in advance). This includes the price of the diskette, the labour involved to copy them and all postage and packaging charges. Do not send us any diskettes.

TAPES

To order VIC-20 club tapes, send \$6.00 for each disk desired in tape format.

The procedure for ordering non-VIC club tapes is to send \$12.00 for each disk desired in tape format. Most non-VIC disks require two tapes and you will receive both tapes for the \$12. For the few disks that will fit on a single tape, an additional free tape will be sent to you.

Send all orders to:

TORONTO PET USERS GROUP
1912A Avenue Road, Suite #1,
Toronto, Ontario, Canada
M5M 4A1

Include:

1. Membership number
2. Return address
3. Payment by cheque or money order

From left to right: Joy Bennett (Entering memberships); Chris Bennett (Business manager); Doris Bradley (Answering inquiries); Bruce Beach (TORPET Editor); Tracy Bennett (Mailing memberships).

The TPUG office is open five days a week for members to drop in programs for the club library or articles for the TORPET. The office is a very busy place and we all make an effort not to distract the employees from serving the membership as a whole.

Some of the services performed in the office include enrolling new members, sending out club diskettes, answering inquiries, and renewing old members.

It is anticipated that the rapid expansion of the club will mean that it will require even larger quarters and more employees in the near future.

More members may mean that the club will be able to hire a full time library co-ordinator and possibly a systems consultant to answer members technical questions.

MORE MEMORY FROM MEMOREX.

Buy a box of 10 Memorex 5¼" Mini Flexible Discs and we'll send you an additional disc free.

Whenever you buy Memorex Flexible Discs, you're getting excellent memory. But right now, when you buy Memorex 5¼" Mini Flexible Discs, you also get *more* memory. Because for every box of 10 discs you buy, we'll send you one Mini Disc free.

Look for specially marked boxes of Memorex Mini Flexible Discs.

Or ask your dealer about this great Memorex deal. You'll not only get excellent discs, you'll get *more* discs.

**Improve
your memory
by 10%.**

Offer ends March 31, 1983. Offer good only in Canada.

CBM/PET INTERFACES

The Connecting Links

CmC provides the link to increase your computer's functional ability. The following models come complete with case and cables and have a 30 day money back trial period.

PRINTER ADAPTERS

- addressable-switch selectable upper/lower, lower/upper case
- works with BASIC, WORDPRO, VISICALC and other software
- IEEE card edge connector for connecting disks and other peripherals to the PET
- power from printer unless otherwise noted

RS-232 SERIAL ADAPTER — baud rates to 9600 — power supply included

MODEL-ADA1450a \$149.00

CENTRONICS/NEC PARALLEL ADAPTER — Centronics 36 pin ribbon connector - handles graphics

MODEL-ADA1800 \$129.00

CENTRONICS 730/737/739 PARALLEL ADAPTER — 40 pin card edge connector

MODEL-ADA730 \$129.00

EPSON MX-70 PARALLEL ADAPTER — handles graphics — BASIC 4.0 required

MODEL-ADAX70 \$129.00

COMMUNICATIONS ADAPTER — serial & parallel ports — true ASCII conversion — baud rates to 9600 — half or full duplex — X-ON, X-OFF — selectable carriage return delay — 32 character buffer — centronics compatible — power supply included

MODEL-SADI \$295.00

ANALOG TO DIGITAL CONVERTER — 16 channels — 0 to 5.12 volt input voltage range — resolution 20 millivolts per count — conversion time less than 100 microseconds per channel

MODEL-PETSET1 \$295.00

CLUB ACTIVITIES

TPUG Central Meeting Feb. 1983

by I. A. Wright

As usual, the car was running on fumes, my hasty supper producing ominous rumblings, and the parking lot full. TPUG's Central meeting at Leaside High School for February was starting. Lo and behold this time... only a few minutes late! The school auditorium had been over half full by 7:15 p.m. A year ago you could arrive at 7:30 and be in the first few rows.

The meeting was opened by Mike Bonycastle with the statement that the VIC group was meeting in another part of the building. This was another indication of the rapid growth of the club. We were presented with some information about the upcoming PET Conference to be held on May 14 & 15 at the Casa Loma Campus of George Brown College.

There was a call for helpers who would introduce and thank our guests, for people to co-ordinate some activities, and many other jobs. Some of the positions are paid; albeit at a low rate. Gord Campbell, the conference chairperson, made this eloquent pitch and distributed sign-in sheets to interested participants.

Special mention was made of the all-day Machine-Language tutorial by our own Jim Butterfield to be held on the Saturday (May 14th). Any person interested is to register with Gord Campbell at 492-9518 before February 20th. As an added attraction this year, there will be displays and also SALES by local dealers on location. A "Sell and Swap Corner" will be available for members who wish to use this conference to acquire or sell computer-related materials. There will be a small charge for the use of the facilities.

A demonstration of telecomputing will be given at the York Library at 1745 Eglinton Ave. West on Wednesday February 23rd at 7:30 p.m. There will be on-line facilities and among the presenters will be Steve Punter.

The club now has its own business office on Avenue Rd. just south of the 401. The telephone number is 416-782-9252.

The TV-Ontario series on computers is to start on the air at 9:00 p.m. on Wednesday February 16th. Sample copies of the handouts and tutorials were available for those that were interested to see what they had missed. Jim Butterfield (the star?) stated that the show was originally designed for about 6,000 registered viewers who will receive the program package. The registration is now closed since about 10,000 people have registered! Plans are underway to re-release the series at a later date.

Jim presented his latest version of the Ontario Tax Program. Although it will run on most machines, Jim suggested that time pressures made a version for the VIC-20 an impossibility. Any interested programmer is invited to create a VIC version of this very useful program. If you have no interest in using the program to calculate or print out your tax form, you should still look at it for the routines for formatting and inputting.

The remainder of the pre-coffee show was Jim Butterfield presenting an illustrated lecture on relative files. The most important feature is that these files will work on ALL MACHINES. As a "relative" novice I present the following material based on scribbled notes:

```
100 INPUT #15, E:E$,E1,E2 These lines-  
receive data
```

```
110 PRINT E:E$,E1;E2 from the error  
channel.
```

```
OPEN 15,8,15:GOTO 100 This line opens  
the error channel.
```

```
OPEN 1,8,2,"0:BUTTER,L,"+CHR$(25)
```

TORPET March/April 83 page 27

CLUB ACTIVITIES

This line opens a file #1 and a secondary address #2 to the disk. It was a good job that the error channel was open because after explaining this line the message "DEVICE NOT PRESENT" appeared on the screen. A quick flick of a switch powered up the disk-drive and we were off! The variable "L" refers to the length of the individual records that are to be written. At this point the record length has been set to 25 for all records in this file.

```
PRINT#15,"P"+CHR$(96+2)+CHR$(15)+  
CHR$(0)+CHR$(1)
```

This line lets us set up a block of records (254 characters total) and seek out record #15. In doing this, the drive is also setting up 20 other record areas that contain no information as yet. The CHR\$(96+2) sends address #2. For an explanation see pg. 378 in Programming The PET/CBM by R. West.

```
PRINT#1,"JOE"+CHR$(13)+"15";
```

This line writes our record #15 as JOE 15 and must be written at one shot. At this point Jim fielded a number of questions from an obviously informed audience. It was reiterated that records should not be written in parts for safety.

```
PRINT#15,"P"+CHR$(98)+CHR$(10)+  
CHR$(0)+CHR$(1)
```

```
PRINT#1,"ALOUISHUS"+CHR$(13)+"132";
```

This pair of lines will write record number 11 with ALOUSHUS 132. The effect of sending a record too large for the pre-arranged space is that an error #51 occurs, and the record is trimmed to the set length. The example we were shown resulted in a record that said "THIS RECORD IS RIDICULOUS"...

```
CLOSE 1:NEW
```

Knowing that the break to the cafeteria was imminent, Jim then wrote a neat program to read and write a relative file. Note that line 100 does not include the L since the file was created earlier. New files will need to have the line opening file #1 "BUTTER" as above. Line 300 contains the statement CHR\$(R AND 255). You can get the low byte for any number less than 32768 (\$8000) by (number and 255) =low byte.

```
90 OPEN 15,8,15  
100 OPEN 1,8,7"BUTTER"  
200 INPUT "RECORD NUMBER":R  
210 IF R=0 THEN GOTO 500  
220 INPUT "READ OR WRITE":X$  
230 IF X$=R GOTO 300  
240 IF X$=W GOTO 400  
250 GOTO 200  
300 PRINT#15,"P"+CHR$(103)+  
CHR$(R AND 255)+  
CHR$(R/256)+CHR$(1)  
310 INPUT #15,E,E$,E1,E2  
320 IF E<>0 THEN PRINT E$:GOTO200  
330 INPUT #1,N$  
340 PRINT N$  
350 IF ST=0 THEN GOTO 330  
360 GOTO 200  
400 PRINT#1, "JOE"+CHR$(13)+"25";  
410 GOTO 200  
500 CLOSE 1
```

The notes stop here because there was a stampede to the coffee, drinks and donuts. Following this short recess, smaller groups met in various classrooms. The C-64 group were shown Paperclip for that model by Jim Law. Bruce Beach led a group interested in the TORPET, there was a preview of the first half of the TV-Ontario program, and others that escaped my notes.

The club's monthly disk was ready by the end of the break and this is a real achievement considering the line-up of people at the evening's beginning.

On the drive home it occurred to me that I had enjoyed myself, I had learned a great deal, and took home material for further examination. All this for a nominal fee!

TPUG West Meeting

Feb. 23 At Sheridan College

by John Easton

Say, these meetings are getting more and more crowded - luckily the folks at Sheridan can't fit us into any more classrooms or we'd feel the need to split up into interest groups as the Central Meeting does. Might be a great system for efficiency, but something is always lost in execution. At any rate, bear with us friends, and if you've got a better idea, for goodness sake let us know, remember, it's for YOUR benefit that we run these meetings, and all we can do is try different formats, presentations, 'n stuff to try to keep SOME level of interest in meeting content for ALL of you.

NEW STUFF -

Ted Bangay from Sheridan announced that Sheridan is proposing to set up a course to run either 10 Thursday nights (95.00), or 3 full Saturdays (\$125.00) on HOW TO BUILD YOUR OWN COMPUTER. Anyone interested should contact the Training & Leadership Division at Sheridan's Brampton Campus.

A gentleman (who else could ignore all that talking) from York Public Library announced that his library is now loaning out diskettes of public domain PET software (Hint to our librarian: couldn't we, by donation or otherwise, encourage other public libraries across Metro to loan out PET materials? What a boost for our favourite machine, not to mention a convenience for club members.) York Public Library is also now offering computer courses taught by Mississauga's wunderkind and WordPro king, Steve Punter. Imagine how the early Romans must have felt attending Bible classes taught by Peter the Apostle.

Photo: Graham Bailey

There are now five group meetings in the Toronto Area each month. The Central meeting is the largest with approximately 700 attending. This is the West Side meeting.

Autodial on the PET

by David Williams

Toronto

Several of the Bulletin Board Systems (BBS's) in the Toronto area have recently reached a state of extreme congestion. During the evenings, they are busy more than ninety percent of the time. This means that anyone who dials a BBS phone number has less than a one-in-ten chance of being able to sign on to the system. Nine times out of ten, the number will merely produce a busy signal.

Having become utterly bored with fruitlessly dialing BBS numbers, I decided that it was time to take another approach. We always say that computers can contribute to our lives by doing the things which bore and frustrate us, leaving us free for more interesting things, yet I was wearing my dialing finger to the bone while my PET was doing absolutely nothing. Obviously this was a situation in which the machine should take over the task of dialing the numbers, and should alert me only when it successfully made contact with a BBS. In the meantime I could do something more productive, such as watching TV.

Before telling you how I succeeded in making my PET do this, I would like to warn you about the unthinking use of all automatic dialing systems, not only this one, but also those which are available with certain types of modem, such as the Modem--80 and the Hayes SmartModem. It happens quite often that would-be BBS users dial phone numbers which are actually not being used for bulletin boards at the time.

BBS's are in a constant state of flux. Systems come and go almost every week, with the result that many users find themselves with outdated phone numbers. In one infamous example, the TORPET published a number for a BBS which was outdated even before the magazine was distributed! In other cases, BBS's operate on a part-time basis, sharing a phone number which is used for other things at different times, yet

the BBS phone number is sometimes published without referring to this fact. Using an autodialler on a phone number which is actually not being used for a BBS, subjects anyone at the other end to a dreadful situation. His phone is the target of a barrage of calls, yet there is no way in which he can answer by voice and tell the caller the true situation. So, please, never use an autodialler on a phone number unless you are absolutely certain that it is being used for a BBS at the time you are calling. If you are not thoroughly familiar with the system and its operating hours, for example if you have just read of its phone number in a magazine or a BBS bulletin, don't autodial it. Call the number "by hand" first. If it is being used for a BBS, well and good. You can explore the system, making sure of its operating hours, and autodial it in future.

And if the number turns out not being used for a BBS, calling it by hand will allow anyone at the other end to explain the situation to you. He may, for example, be able to tell you the system's new number or its operating hours.

OK. Speech over. Let's get back to the task of making the PET dial phone numbers and alert its users when a BBS is contacted. Obviously this requires both software for the computer and also some kind of hardware connection between the PET and the phone line. Equally obvious, the task (and therefore the hardware and software) can be separated into two distinct functions. The PET must be able to influence what happens on the phone line, simulating what happens when a phone is taken off the hook, dialed, and perhaps hung up. The computer must also be able to receive signals from the phone line, so that it can respond to the presence of a modem answer-tone by alerting the user, or to its absence by hanging up and trying again later.

Projects such as this, which involve both software and hardware, often require some kind of decision to be made as to how much will be done by the hardware, and how much will be left to the computer. For example, the detection of a modem answer-tone (a tone of 2225 plus-or-minus a few hertz) could be done by incorporating a sharply tuned resonant circuit into the hardware.

PET

This would be followed by some kind of non-linear element which would produce a D.C. signal from the resonating frequency, and this could be used to feed a simple on-or-off D.C. voltage to the PET to indicate the presence or absence of the answer frequency. However, there is a digital method of measuring frequencies which can be carried out by the PET itself. In this, the machine simply counts the number of incoming sound waves which arrive in some fixed period of time. This gives a direct measure of frequency which requires very little hardware - only enough to convert the incoming sound waves into square waves of the correct voltage to be fed into the PET.

I decided to minimize the amount of hardware, and to do as much as possible with the computer itself, by writing appropriate software for it. (this is often called performing the task "in software", as opposed to "in hardware".) I also decided to use pulse-dialing for the phone, so that the system could be used anywhere. It might have been easier to dial by feeding simulated "touch-tone" signals into the phone line, and these would have been accepted by my local phone exchange. But not all exchanges can handle these signals, so I decided to simulate the simple pulses which are generated by old-fashioned rotary phone dials, and which are accepted by all exchanges.

A schematic of the hardware is shown in the diagram.

Electrically, it consists of two separate parts, one of which is connected to the PET's user port, and the other to the phone line. The two parts are linked by two opto-isolators. These are devices which contain light-emitting diodes and phototransistors, electrically isolated but arranged in an optically sealed container so that light from the diode can fall into the transistor. They allow the PET to communicate with the phone line while being totally isolated from the high voltages on it. The phone line is also protected, since its part of the circuit is entirely passive, with nothing which might feed damaging voltages into it.

The H11D1 isolator is a type with a high-voltage phototransistor. This, in a Darlington arrangement with the high-voltage

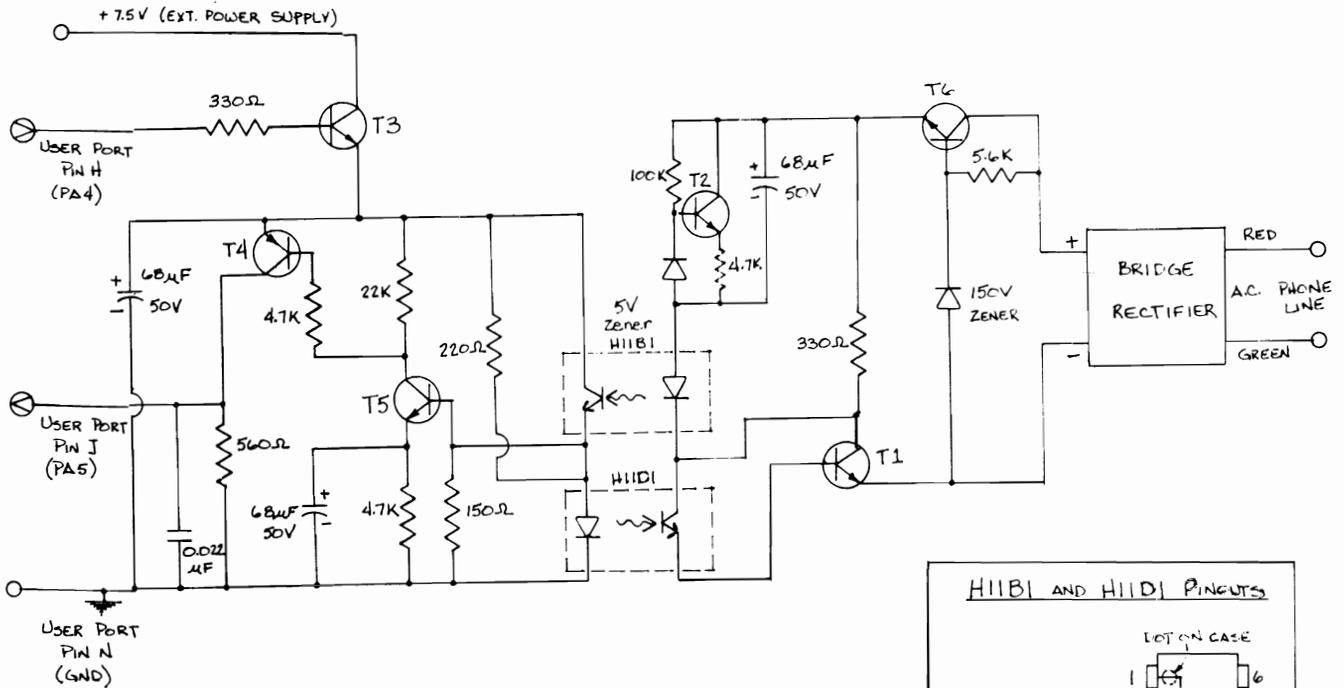

transistor is used for switching the phone circuit on and off, both to simulate lifting and hanging up the phone, and also for pulse-dialing. This is controlled by a signal from the PET's user port Pin H (PA4), through an emitter-follower transistor, T3. The emitter of this transistor is essentially either at zero or plus five volts, relative to ground, depending on the Pin H signal. This either does, or does not, drive current through the diode in the H11D1, closing or opening the phone circuit.

When the phone circuit is closed, a current of about one milliamp passes through the constant-current arrangement around transistor T2, biasing the diode in the other opto-isolator, which is a type H11B1. The A.C. component of the phone signal bypasses the constant current arrangement, by means of a capacitor, and thus passes through the opto-isolator. The transistors T4 and T5, which are arranged between plus five volts and ground, amplify this signal and clip it to a TTL-compatible square wave, which is fed into Pin J of the PET's user port.

The software to run this arrangement is available for downloading from TPUG's BBS. Its phone number is (416) 223-2625, and the hours of operation are 7:30 p.m. to 9:00 a.m. (Eastern time) Monday to Saturday, and all day Sunday. It consists of a machine-language segment called "Autodial ML", which generates dial pulses, counts incoming sound waves, and performs various other functions, and a BASIC driver program called "Autodial Term". This is an expanded version of Steve Punter's public-domain terminal program "Terminal.R12". It contains all of Steve's routines, together with several other functions which have accreted to it over the past year or so, including the Autodial routine.

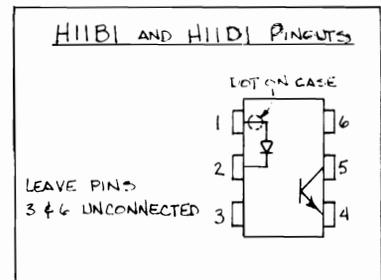

The signal with which this system alerts its user, when an answer-tone has been successfully acquired, is a combination of CB2 sound and flashing of the entire screen between normal and reverse field. If you have a large-screen PET, the sound will be audible, though not very loud, from the machine's own speaker. If you have a small-screen PET, or if you wish to make the

Enter the Z8000

by P.J. Rovero

Monterey, CA

Commodore computer users have had few central processor adjustments to make in the past. In the midst of changing ROMs, keyboards, and screens it sometimes seemed that the 6502 was the only part of their systems that did not change from model to model. The picture has changed somewhat with Commodore's introduction of the 6509 and 6510 processors but these are basically 'souped up' 6502s. A number of other companies are bringing add-on Z80, 6809, and 68000 processors to market. These machines normally do not replace the 6502 but can be selected as an alternative.

A major change is in the wings. Soon after Commodore and Zilog announced a technology transfer agreement, Commodore selected the Z8000 as the chip to be used in their future 16 bit processors. The Z8000 processors are very capable, but complex and very much different than the familiar 6502.

Table 1 lists a few of the Z8000 characteristics. The Z8001 is the more complex of the two and is capable of directly addressing 48 MEGabytes of memory. The Z8002 addresses 'only' 448K. These memory figures may seem large but the prices are decreasing as fast as the need for more memory is increasing. The processors divide the total address space into 7 smaller address spaces. Separate instruction, data, and stack address spaces are provided in each of two modes. In the user mode certain opcodes are privileged or unavailable for use. This can be used to provide operating system or proprietary software security. Both processors have 64 K bytes of input/output address space.

This form of memory segregation is new for microprocessors. Multiuser mini- and mainframe computers have developed these systems over the years in response to disruptions of operations caused by intentional

or accidental interference between systems and user programs and data. Note also the huge (by current standards) stack address spaces. The large segregated stack is advantageous in implementing multi-user and concurrent operating systems, high level languages, and supporting extensive interrupt processing.

The instruction set of the Z8000 contains 414 variations of 110 instruction types. Ninety percent of the instructions use the 5 main addressing modes on 8, 16, or 32 bit data types. The processor has 16 16-bit registers which may be grouped into combinations of 8, 16, 32, or 64 bit registers. The numerous and flexible registers allow extensive data manipulation and calculation to be performed entirely within the register space with register addressing, which is usually the most time efficient addressing mode. Many Z8000 opcodes directly execute complex functions that would be coded as subroutines on most other processors. Instructions are available for string and block searches, comparisons, and transfers; division with both quotient and remainder result; and byte/code translation using tables. A group of opcodes has been reserved for the use of extended processing units. These are special purpose processors designed to relieve the CPU of such time intensive tasks as floating point arithmetic and local network communications.

The assembly language for the Z8000 is understandably complex. Learning it will be quite a challenge for those programmers now comfortable with the 6502. The new mnemonics, register structure, and address spaces will at first complicate the task. Eventually the capabilities of the Z8000 will allow the programmer more freedom and less restrictions. The users of application packages and high level languages will reap the benefits without such drastic adjustments.

NEW PRODUCTS

As far as the author can determine, Olivetti is currently the only manufacturer with a Z8000 computer and operating system 'on the street'. Whether Commodore uses the same or similar operating system remains to be seen. At this point there is no 'popular' Z8000 operating system.

Programmers who wish to learn about the Z8000 before Commodore's new generation of 16-bit computers are introduced should read the 'Z8000 CPU User's Reference Manual' (Prentice-Hall 1982).

The Agro-Electronic Show

The concept of the show and seminars has evolved to represent the total management of the farm with all electronic means, not just general purpose computers. The use of electronic control and monitoring increases the information needed in the management process. The general purpose computer is only the last link in management process. The data can be presented to it either by manual (typing) or automatic (electronic sensors) means. If the computer can then take action without human intervention, it becomes a control system.

EATON'S

Smith-Corona introduces the first printer with real character at the unreal price of \$1095.*

The Smith-Corona Daisy Wheel Printer

Until now, if you wanted to include a reasonably-priced printer as part of your computer or word processing system, you had to use a dot matrix printer. Daisy wheel printers were just too expensive.

Not anymore. Now Smith-Corona* offers a daisy wheel printer at such an incredibly low price, you can't afford *not* to include it. That means that even the smallest installation or business can now have letter quality printing capabilities at every work station.

The Smith-Corona printer operates with micro-processor-controlled daisy wheel technology, and is available with industry standard serial or parallel data interfaces.

Best of all, it produces results identical to those of our very finest office typewriters – printing with real character. So it can be used to create letters or documents that have to look perfect. As well as financial statements, inventory reports, direct mail campaigns – anything that requires quality printing:

And it's easy to use – just turn on the power, load the paper and away it goes. (It works equally beautifully with letterhead bond or fanfold paper.) There are drop-in ribbon

cassettes and a choice of easy-to-change, snap-on daisy print wheels for a variety of fonts.

So why not get your hands on a real bargain: letter-perfect printing at an amazingly low price. Because, thanks to Smith-Corona, a printer with real character is no longer expensive.

Ask for it by name.

T

Standard VIC 20

no additional memory needed

(CG008) Alien Panic \$12.95

Race against time as your guy digs holes to trap aliens in 4 floor ladder, brick construction site. Requires joystick.

(CG096) Antimatter Splatter \$24.95

This game is as good as its name. Another pure machine code game, this one is fast! The alien at the top of the screen is making a strong effort to rid the world of humankind by dropping antimatter on them. The splatter cannon and you are our only hope as more and more antimatter falls. Joystick again is optional equipment.

(CG026) Collide \$12.95

"Vic" controls one, you the other as cars go opposite directions on 4 lane track. Requires joystick.

(CG094) Exterminator \$24.95

Recently scoring a rating of 10 out of a possible 10 this game was praised as "one of the best I've seen on any computer" by a prominent reviewer in a leading magazine. The idea is to shoot a centipede before it overruns you, the problem being every time you hit it, it divides into two separate shorter ones. Several other little creatures bounce around during this struggle. All of them lethal. 100% machine language makes the rapid fire action very smooth. A joystick is optional, but as always, recommended, (a track ball is also very nice!).

(CG054) Krazy Kong \$12.95

Three screens, a gorilla, barrels, and changing difficulty levels help to make this one of our most popular. Joystick optional.

(CG098) Racefun \$19.95

Extensive use of multicolored character capabilities of the "Vic" make this one very appealing to the eye. Fast all machine language action, quick response to the stick or keyboard controlled throttle, combine with the challenge of driving in ever faster traffic to make it appeal to the rest of the body. Joystick controlling is an option.

(CG058) Rescue From Nufon \$12.95

Must find 30 hostages in this 100 room, 5 story, alien infested, graphic adventure game. A continual big seller. Keyboard only (n. = north w = west etc.)

(CG068) The Catch . . . \$12.95

Another all machine language game based on the principle that one person with one joystick guiding one catch/shield can catch everything that one alien can throw at one. The action comes slowly at first but by the fourth wave you'll be aware of . . . "The Catch" . . .

Expanded Memory Vic 20 Games

(CG090) Defender On Tri \$19.95

Pilot a defender style ship on mission to save trapped scientists from a fiery fate (they are aboard an alien vessel deep in the gravity well of sol). Excellent graphics. Short scene setting story in the instructions. "Defender On Tri" requires at least 3K added memory.

(CG092) 3D Man \$19.95

The maze from probably the most popular arcade game ever, with perspective altered from overhead to eye level. The dots, the monsters, the power dots, the side exits, the game is amazing. "3D Man" requires at least 3K added memory.

(CG088) Space Quest \$19.95

Our first 8K memory expander game and its a beauty. The scene (a short story is included) is far in the future, a time when man's knowledge has reduced an entire galaxy into a mapped series of quadrants. This game has strategy (you plot your own hyperspace jumps on Galaxy map), action (against a starry background you find yourself engaged in a dogfight, laser style), exploration (you must fly your ship deep into caverns to pick up necessary fuel). "Space Quest" requires at least 8K memory expansion and a joystick.

Commodore 64

(CG602) 3D-64, Man \$19.95

This available on the expanded "Vic 20" game, has been completely rewritten for the 64 and uses sprites, sounds, and other features not available on the "Vic". This one requires a joystick.

COMMODORE-64

SCRIPT 64

A Review by Marc Swanson

Toronto

Script 64 is a word processing program for the Commodore 64, written by David Foster and released by Richvale Telecommunications. It is an excellent word processor that is easy to use and powerful enough for most needs.

What I Liked

A word processor stands or falls on its text editing features and the ease with which you can make a successful printout. The program has to be powerful enough to accommodate a wide variety of uses, while remaining easy enough to use without having to phone the distributor. For the most part, Script 64 handles editing and printing powerfully but simply.

Editing

Besides the usual methods of inserting and deleting large or small amounts of text, Script 64 also allows for a variety of other ways to enter and manipulate text. French text can be entered directly to the screen. The powerful global search and replace option allows a user to search for and replace multiple items of text at the same time. There is a numeric mode for adding and subtracting columns of numbers. Text is easily centered. Depending on your printer, Script 64 also allows you, from edit mode, to enter commands for superscripts and subscripts, underlining, bold print and italics print. All of these are easily and quickly accessed with, at most, three keystrokes.

Printing

Script 64 prints using any serial or parallel printer that interfaces with the 64. Script 64 allows the user to see his text formatted before it goes to the printer by

sending the printout to the screen. The format of the printout can be easily altered from a Control Map containing print format instructions.

Other Features

There are a number of other user-friendly features, such as three Help Screens if you get stuck, prompts before you do anything damaging to your disks and a dictionary/spelling checker mode which checks the spelling of words you build up from your own text and vocabulary. There are other minor but useful features such as the ability to change text and background colors (a must with some monitors!) and a print option using the RS-232 port that allows a printout to be sent over a modem.

Most of Script 64's major options are displayed on the menu line and easily accessed with two keystrokes.

What I Did Not Like

The list of things I did not like about Script 64 is fairly short and very picky.

The video print scrolls horizontally to allow you to use the 40-column display to view an 80-column printout. At first this is very impressive, but after a while, trying to follow the scroll with your eyes becomes irritating. It is still a necessary and very useful feature.

The program saves word processing data in numbered screens. This makes saving to disk or tape very convenient, because there is no need to name a file or specify drives when saving. The "Index" part of the program provides a place to log the name of the file saved in the numbered screens. However,

COMMODORE-64

the user has to go into the Index to log the contents of the various screens. This is time-consuming and unless you are very conscientious about making entries to the index and keeping it updated, you soon lose track of which numbered screen contains what data.

The dictionary/spelling checker mode of the program does not really check the spelling of words. It only checks to see whether or not you have used the word before in your text, and logged it onto a dictionary disk.

Summary

I liked Script 64 very much. The things about I did not like are not serious. They are the result of longing for an ideal word processor that only exists in my mind. In general, it is easy to use, and well worth looking at for serious use.

Script 64 is available in tape or disk version for \$129.00 from Richvale Telecommunications in Richmond Hill.

RAPIDWRITER

Review by Mark Caplan
Concord, Mass.

Being the owner of a Vic 20 and a computer novice, I was desperately looking for a word processing program that could be easily used and understood. I have looked at most of the programs available to VIC users and was very discouraged by the inadequacy of the instructions and the inability of the programs to work with printers better than the 1515 or 1525 -- that is until I found **Rapidwriter!**

This program, offered by H.D. Manufacturing Inc. of Leverett, Massachusetts, is a bargain at 39.95. Pages 258 and 260 of the February issue of **Compute Magazine** sum-

marize the many features offered by the program. What it fails to mention is how user friendly the program is and how well documented the instructions and tutorial are. The author makes extensive use of the function keys and simple key commands for the most commonly used features, such as line feed, page feed, centering, double sizing of characters, underlining, erasing, tabbing, vertical spacing, duplicating and moving lines, etc. All of the keys on the VIC 20 are used in their standard mode. There are no special commands to remember to change format.

The program allows multi-column printing, which is easy to do, and has a special feature which allows the user to simply go into a calculator mode, make a computation, and return to the program with the answer noted in the proper place. Additionally, the program makes extensive use of simple prompts for all of its features. In short, it is like following a bouncing ball, whether you are loading text, saving text, printing, or formatting.

The only negative criticism this writer can offer is the lack of the ability to right-hand justify.

The author has the program available for tape or disk, the VIC 20 or the 64, and for most any printer that can be hooked up with either machine. This writer has a Commodore 4022P printer which is normally used with the larger Commodore machines. The author furnished me with a program version that works beautifully with that printer.

Most important the author furnished a well written, easy to follow 30 page instruction and 15 page tutorial with the program. This is a feature which I have found lacking with most programs offered to the small home computer buff. I also found out that quantity discounts are offered to VIC user groups who purchase in lots of five (5) or more.

For those of you who would like to use your VIC as a word processor, I would highly recommend **Rapidwriter**.

SuperScript Review

by Terry Taller

Kanata, Ontario

As with any product which is both first in its market, and successful, it doesn't take long for similar products to appear which will compete for a market share. These new products can be in one of two categories -- a pure imitation or an improvement upon the original. **SuperScript** is in the latter category; while it lacks a couple of the features of Punter's WordPro 4 plus, it has important improvements in a number of key areas. Since **SuperScript** is less than half the price of WordPro, PSI must now improve its product or face the fact that it will have to severely reduce its price for WordPro.

It is obvious that when **SuperScript** was written the serious shortcomings of WordPro were kept in mind. The author, Simon D. Tranmer, states that he used the opinions of Commodore Users Groups in Britain to refine the package; he must also have listened to reviews of WordPro.

The most commonly heard complaint about WordPro is the lack of space in memory -- in fact 115 lines. **SuperScript** provides a total of 250 assuming an 80 column production. While there is no Extra Text area, for most of the work required by most writers, this is no loss.

The next advantage is that separate lines are not needed for line or centering commands. For instance, if you are typing a standard paragraph (as I am right now), instead of having to leave a blank line between paragraphs one need only put the (ctrl) In1 (return) at the end of the previous paragraph; not only convenient, it saves memory. The same is true for centering functions; instead of requiring a separate line to turn centering on or off, it can all be done on one line; e.g., (ctrl)cn1. THE BIG BROWN FOX (ctrl)cn0 which, again, has the effect of saving lines and memory.

The next feature, which I enjoy best, is that Tranmer has allowed users to access features in non-CBM printers. For instance, I use a Star Micronics GEMINI-15 (I can't see why anybody would buy an EPSON printer now) which has italics in its ROM. One needs to get at the Escape function to use it; **SuperScript** provides for this. When writing this review, instead of having to use the underline feature to designate italics to the editor, I simply called in the appropriate control feature to turn italics on and off. Very nice.

In WordPro one spends a lot of time moving the cursor up and down through the text. In **SuperScript** I use the control function and space bar to move forward through pages and control shift/space to move back through pages. Again, a convenient time saver.

The next important difference from WordPro is that you can use a maximum of 240 columns. Admittedly one can as well on WordPro but the screen wraps and you have to count your strokes to make sure that you (return) at the appropriate moment. In **SuperScript** the screen will pan to the right as you type in your work and wrap at the designated right margin. This makes it so much easier to set up work for a 15" carriage printer like the GEMINI-15. Like WordPro, in **SuperScript** you have to output to video to see the setup; unfortunately when you use a right margin larger than 80, "what you see, ain't what you'll get." To make life easier when reviewing a screen larger than 80 columns, Tranmer built in a panning function; i.e., when you press (ctrl) right-cursor all you have to do is sit back and watch as the screen moves in front of you -- if you want to speed up the action you hold down the shift key. Again, very nice if you are working with 132 columns.

PET

The next outstanding difference between SuperScript and WordPro is the fact that you can get at the disk functions without losing your text from memory. This alone will make people buy SuperScript instead of WordPro. When I think of the number of hours I have spent saving items because I wanted to get at the Directory with WordPro I could cry: as rookies with WordPro how many of us have called in the Directory only to have forgotten to save the text in memory. Not fun!

Most of the control commands in SuperScript are identical to those of WordPro -- and some of them make more sense. For instance, to get into the insert mode instead of Shift plus RVS in WordPro, you RVS plus I to turn Insert ON and RVS plus O to turn it OFF.

What doesn't SuperScript have? It doesn't have an arithmetic function when it comes to columns of numbers. It does have decimal tabs, though. Also the position of tabs is not displayed on the screen: instead to see the position of tabs you must (ctrl) plus P and the tabs are displayed as slashes on the status line. Because of the work that I do, I find this inconvenient. SuperScript provides the option of vertical tabs --if you want them.

It is obvious that money has been saved with the documentation. It is not nearly as thorough as WordPro. It comes in a spiral bound binder which I immediately removed

and three-hole punched. Surprise -- Precision Software used metric sized paper which doesn't fit your normal binder. A very nice feature provided by the publishers is a Quick Reference Guide in the middle of the documentation; also on the disk provided is the Quick Reference Guide which you can print out and keep handy. I do think that anybody trying to get into SuperScript without any previous experience with a package like WordPro will spend a lot of time familiarizing themselves with it. That's a small price to pay for a difference of \$300.

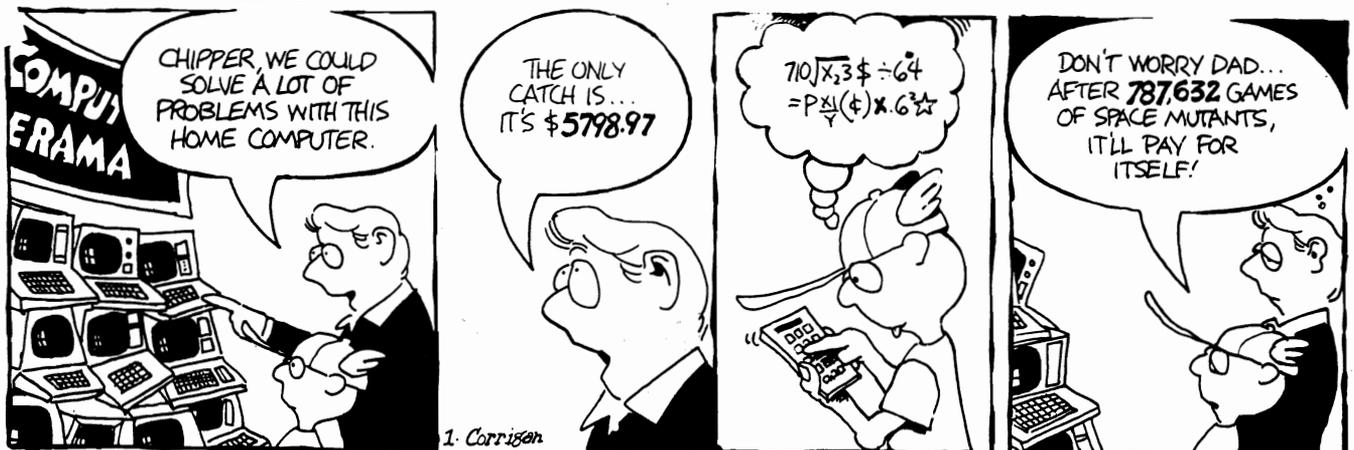

Another problem I found with SuperScript is the flashing cursor. I find the flashing cursor useful when programming but it is a nuisance when writing.

I could spend a great deal of time giving an item for item comparison of SuperScript and WordPro which isn't the point of a review. There is no doubt in my mind that a person who wants an excellent package which would meet all of the needs of the average office should buy SuperScript instead of WordPro. Not only is it a better buy but the files created by SuperScript are compatible with WordPro, WordCraft, and Silicon Office.

The current price of SuperScript is \$150 Canadian.

PET

Storywriter

A Review by I.A. Wright

Toronto

STORYWRITER - Tape loaded machine language wordprocessor for junior students using the PET computer. Available for educational use from the Toronto Board of Education, 155 College St., Toronto (416-598-4931). The program is free, but restricted in use as above. A single page 8 1/2"x 11" of hardcopy instructions are included.

name across the top of the screen. On printout, this information is automatically formatted into a header.

The child can edit the story using the INST/DEL key to remove letters, words or phrases, or insert spaces or lines. The CLR/HOME key is used to return to the start of the screen or text. To print, the child is presented with a few simple instructions and a choice of Commodore or Epson printers and the story is printed.

Storywriter is a most valuable program for teachers of junior (grade 3 - 6) students. In essence a simple wordprocessor, Storywriter can introduce students to the marvelous world of the micro-computer. This simple program can answer the teacher's requests for programs that will aid in the teaching of the English language.

If the correct printer is chosen, the output will be in double width characters which is great for smaller children. Later, the teacher may decide to print the files using the "opposite" printer choice. This will produce a 40-column output with the right side of the page ready for a picture.

Written by Joe Vayda, and C.C. Capon. Storywriter uses a simple one-screen menu.

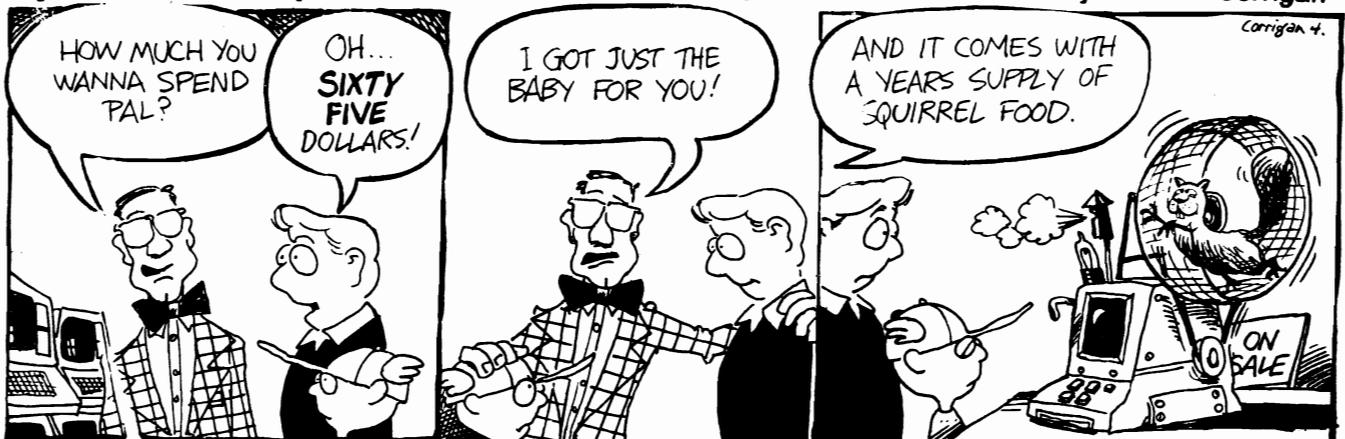

The student can load a story, save a story, print a story, write or edit a story file, erase a story, and leave Storywriter. These are all the commands and can be obtained through one numeric keypress.

A number of teachers in both City and borough schools are using this program with their pupils. A few of the comments that I have heard include ... "I've never had a Grade 5 class write so much!" ... "The children want to correct their stories" ... "I can sit with a child and explain corrections and omissions without using a red pen". The response of the students is equally enthusiastic. This program is terrific!

The program starts by asking the student for his/her name. This input then becomes part of the program, along with the title of the story. As the student writes, the program automatically scrolls the title and

PAPERCLIP

A Review by I.A. Wright

Toronto

PAPERCLIP - ROM, disk and manual from Batteries Included, 71 McCaul St., Toronto M5T 2X1, Phone 416-596-1405. The program is available for all 4.0 ROM Commodore machines (including the C-64) and can be ordered with French or Math character sets.

At a quick glance through the latest issue of COMPUTE! magazine, I found advertising for wordprocessors for Commodore computers from \$16.95 to over \$300.00 U.S. The U.S. price of Paperclip is \$125.00 (\$150.00 in Toronto) and is in the middle price range. The features of Paperclip, however, make it one of the best wordprocessors available regardless of price.

The Paperclip version reviewed is #2.84 and consists of a 2K ROM that sits at \$A000, an 85 block disk program, numerous printer files, and a 112-page manual. Although it comes on disk, Paperclip is completely tape compatible. This has proved a boon to the many teachers who have a 4032 PET with a cassette drive in their classroom.

As with all quality wordprocessors, Paperclip allows complete manipulation of text. The total command list has over 100 separate functions. In addition there are 41 formatting commands. This may seem somewhat overwhelming to a novice, but within a short time the system can be broken into the "commonly used" and the "look-up" functions.

Text can be appended, inserted, deleted, moved, copied, and transferred by word, phrase, line, and range. The ability to instantly change the position of some piece of text is a major advantage of all wordprocessors. Paperclip provides all the combinations that you could possibly want.

A feature of Paperclip that puts it ahead of its competition, is the ability to manipulate columns as well as text lines. One of the great difficulties of using the 40-column PET as a wordprocessor is the formatting of printer columns for 80-column printers. The same might be said for formatting 126 columns on an 8032. The Paperclip solves this problem by allowing you to set the screen width to any value from 40-126 columns, and then the screen will scroll **horizontally**. Having been involved in writing charts for publication, I know how valuable this feature is. I suggest that any such files be set up as linked files because the line width cannot be changed within a text file. The file-length in Paperclip is 222 lines of 40-column text, but using linked files you can write forever.

Another feature that relates to columns is the ability to set numeric tabs so that all decimal numbers are aligned neatly. If you decide that the columns should be moved, there is a command to shift them. If you forget a column, then insert one. Other column commands include: set, erase, repeat, add, subtract, and even sort. Yes you can enter names, addresses, phone numbers, etc., and sort the entries by sub-fields!

Disk operating commands such as reading errors, global copy and scratching of files can be sent from within Paperclip. You can change printer and disk device numbers to allow multiple peripherals. Very useful is the support of the Arbiter system that is in use in many schools. From within Paperclip the user can enable or disable the arbiter, or grab exclusive use of the bus. Teachers with access to a computer studies room can turn it into a wordprocessing room with up to 32 computers using one disk drive and printer.

PET

Some business functions are well supported by Paperclip. String searches can also search and replace so that references can be altered throughout a file allowing "boilerplate" paragraphs. A similar function uses variable blocks which are kept in a separate sequential data file to change addresses and salutations on form letters. One enterprising young man uses this system for personalized handouts that advertise his business.

When you are ready to print your formatted text to the printer Paperclip offers another feature that is worth its weight in 4032's - the video output. Other wordprocessors such as WordPro 4+ have this feature, but it is not available for the 4032 PET. Admittedly, the 40-column PET only shows the left-hand side of a printer page, but that's enough to be of great value.

The video output can be globally linked and can insert variable blocks just like a regular print out. The screen scrolls vertically, and can be paused and re-started using the space bar. The scrolling stops automatically at the end of each page, and you can quickly see those "widows" - hanging lines at the start or the end of a paragraph. This video output is formatted the same as the hard copy, thus you can see changes to indenting, headers and footers, and pagination before you run the printer. All special characters are shown in reverse video so they can be checked also. In my estimation, this feature alone makes the Paperclip THE wordprocessor for 40 column screen machines.

Once the written file has been checked for accuracy and format, you can output to a printer. Not just a few kinds, but any printer can be supported. If your printer can print boldface, italics, emphasized, wide, super or subscripts, etc., then Paperclip will allow you to send these commands from within the text. If you have to pause to change a daisywheel, then put that command in the text at the appropriate place. If you have access to a number of types of printer, then you can change printer files and output to each of them without re-typing or re-loading.

If you use only one printer, then the disk has a program to re-write the Paperclip program so that your special printer file is automatically loaded when you start. If you find an error on page 15 of the text you have written, use the video output to print pages 1 - 14 then press "p" to print a corrected page 15. In my estimation this flexibility of printing is another of the features of Paperclip that puts it at the head of its competition. It has saved me reams of paper.

An unusual function in a wordprocessor that is as inexpensive as Paperclip is the "tb" command. Using this you can create a table of contents as you write the text. Auto-indent is a useful function for report writers because it will offset the first line of all subsequent paragraphs to a variable amount. Another function is the ability to predefine phrases that are repeatedly used in the text. The phrase "Toronto PET Users Group" can then be written with two key presses. Any commands that may effect the existing file are double checked using an "Are you sure?" input. This has saved my text on more than one occasion.

What are some of the drawbacks to this program? The most upsetting to me has occurred at the startup when after loading the program and a text file to work on, the program exits to monitor and then locks up. This does not happen very often, but it can prove rather frightening. Another bug is the extended use of the insert key which forces the program into uppercase "loc". Again, this does not happen all the time. An earlier version of Paperclip did not support the "vp" or vertical position command.

I assume that there will be updates and revisions to correct this latest version. Beyond the bugs the program has a few areas that would be advantageous if included. The disk directories can be read without losing the current file, but cannot be printed without exiting the program. The video output cannot be printed at a variable speed. There is a definite need for a tutorial that would walk a neophyte through

the system. The manual is valuable if you know what to look for, but it is not good enough for a person new to wordprocessing.

To sum up, I have used WordPro 3+ and have access to \$12,000.00 Burrough's wordprocessor systems. But I have bought Paperclip for my use and for the use of my staff. I heartily recommend this program to you.

Butterfield Box

by Jim Butterfield

Toronto, Canada

Computers and Show Biz

Since many local TPUG members have noticed that I have a television series under way (TV Ontario, The Academy, Wednesday nights) ... I should probably comment on television as a means to computer education. These comments are my own, of course; I'm not attempting to give you TVO's opinions or position.

I had a fair amount of input during the writing of Bits and Bytes, the half-hour program on computer fundamentals. Here are some of the factors that entered into the picture:

You can't teach programming in a half-hour TV show. The average viewer's attention span won't allow it. Such a thing might be possible in, say, five minute chunks ... but a half hour of programming theory would overload almost all watchers. It seems to me that beginning programmers need a great deal of hands on usage .. and that won't fit the format. I could imagine saying, "OK, now try it yourself; I'll just wait here. Be sure to be back in five minutes..." Here's a silly thought: many inexpensive computers connect to a home television set. So the dialogue might go, "OK, disconnect this program now and try it on your computer ... be sure to hook up again in five minutes so we can continue..."

We didn't want to produce a "gee whiz" show. This is the easy way out: computers chatting with you, walking around and lighting your cigarette, driving your car to the gas station. It looks good. It's even technically feasible to a certain extent. But it doesn't have much to do with the way we use small computers today, or even with the things we need to know about computers.

So what's left? A dull recital of computer applications in home, school and office? Never!

Small computers are exciting .. intriguing .. thought provoking .. challenging. And that's what we decided to show: the sense of discovery; the fun of it all. As club members, we know that people get caught up in computer activities: they like to chat, swap notes, brag, ask questions and in general interact with each other. Why? Because it's great fun ... even when we're learning.

By showing "Everyman" learning about computers, and having a good time doing so, we can show an essential part of our own experience. On the way, a good deal of solid information can be given about small computers, how they work and how they are used.

The term "Computer Literacy" has been used for this type of thing. You won't end up an expert; but you will have been exposed to a wide variety of microcomputer facts, buzzwords, and applications.

That's fine for the first half hour. What about the second part - the Academy on Computers, with almost-live" follow up?

In some ways, The Academy is more limited. It doesn't use animation or location shots. It's all done in the studio in one taping session. Yet it has some advantages, too. Bits and Bytes was restricted to two actors, each with a role to play. The Academy portion isn't so restricted: we can bring in guests, and we can be ourselves. We can be more informal; indeed, we have to be, since the show can't be scripted with the lavish detail that was given to Bits and Bytes.

The Academy must relate to Bits and Bytes, since the two run together. It can't say exactly the same things. But it can reinforce; it can supplement;

it can complement. We can show things from a different angle. We can add more detail. We can ask users about their experiences.

One thing that would be nice to do - but it's hard to do - would be to tell people what to buy. I know that members of TPUG might have very strong views on this subject; but even here, we'd all give a similar answer: you must decide what you want to do with computers before you can know which computer you need. And here we have the chicken-and-egg situation: you often don't know what you really want to do with a computer until you've tried your hand at using one. So how can we advise our viewers what to buy?

There are a number of possibilities. If they do not have a computer now, we can show them how computers are used. We can teach them the technical ideas and buzzwords so that they can better fend for themselves in a computer store. We can let them hear the experiences and opinions of present day users. And perhaps we can suggest that they start with an inexpensive computer and expect to trade up as they understand better what their needs are.

It would be unfair to mention the two half hours without pointing out that the TVO Computer Academy has a third element: the additional resource materials that go along with the broadcast. Registrants get a lot more in the way of materials and interaction with the Academy than do mere viewers.

What about computer brands? There's a fierce loyalty among users for their own machines. But during discussions with users, it's interesting to note that you cannot tell the machine just from listening to a user recounting experiences or giving opinions. Only when a product, game, or special feature is mentioned by name can we guess which machine is involved. Maybe we have more in common than we often think...

Around the World in a Month with TORPET

A look at our list of international TPUG readers provides a fascinating trip touching on all six continents. Let's head west--hopping from Australasia to Asia, Africa, Europe and South America.
