AT LAST ... SUPERIOR SOFTWARE FOR THE COMMODORE 64 COMPUTER

COMMODORE**64**

PERCY PENGUIN £7.95

The best version available for the COMMODORE 64 computer. Percy is trapped in an ice maze which is populated by the deadly animals. It's only hope of survival is to avoid them by finding the holes of them. Unfortunately, whenever it seems that he has been a disaster ailed creature, it starts, roars, dives, speeds, excellent graphics and sound. (Playfield or limited)

NEW RELEASE

Many of our titles are available in Boots, W.H. Smith, John Lewis, Fumbletons, Lloyds, Curry, HMV, Greaves, Gellenshorns, and Spectrum Shops. Also at all major computer dealers - Elite Computers, Micro Management, West Coast Personal Computers, Microstyle, Electronics, SD Computers, Computerco, GIM Computers, etc. Our software is also available through all the major distributors, and directly from us by mail-order.

CHESS £7.95

Chess and Draughts are written by the author of our successful BBC and Acorn version. These programs, both programs, is a highly versatile implementation of the game. Play block or white against the computer or a human opponent. The skill level of the computer's play can be varied subtly, and moves are entered either by coordinates or cursor control. Moves can be taken back if an error has been made, and the board can be modified at any time. Games can be "saved" or "loaded", and the lost game can be replayed. The computer will, if requested, suggest your moves.

EDITORIAL

COMMODORE'S TWO NEW machines, the C16 and Plus/4, have been a long time coming. Originally announced at the CES show in Las Vegas in January, the new machines finally made their public debut in the UK at the Commodore show in June, though they were not available for sale until September.

The C16 is designed as a direct replacement for the long-serving VIC20, production of which has now ceased. With 128K RAM and 128K ROM, the C16 offers more memory than the Vic at the same price of £139.95. With enhanced graphics and sound capabilities, the C16 looks set to revitalise Commodore's position in the low-end games market.

But, the Plus/4 is not aimed as a direct replacement for the ever-popular 64, though comparisons will undoubtedly be drawn between the two machines. The Plus/4's main distinguishing feature, in the name implies, is the suite of four integrated software packages — a word-processor, spreadsheet, database and graph-plotter. Applications, rather than games, provide the key note.

However, the Plus/4 integrated software has not met with universal acclaim. Admittedly, the four programs all reside in memory at the same time and have the ability to exchange information, but their scope appears to be limited. The spreadsheet can display information as a bar-chart, but not as a pie-chart. The word-processor lacks right justification.

The Commodore 64 will undoubtedly continue to sell in quantity well into next year, as will the new C16. Sales of the Plus/4 may be more problematical.

What must be worrying Commodore, however, is the question "what comes next?". By the middle of 1985 the venerable 64 will be starting to show its age. Will Commodore attempt to replace it with a new machine, or will customers be left to choose between the more limited C16 or the applications-based Plus/4? And, to help Commodore concentrate its mind on the problem, Atari's shadow may be starting to loom large by next year.

For the price of ten aliens you can
communicate with far friendlier

Imagine the benefits of being able to communicate with other computer users. Of letting your computer save money on new software as well as helping improve your programming skills.

And wouldn't you be better informed if your computer kept you up to date with new developments in the computer world.

Just a few of the ways in which our Modem helps a Commodore 64 become more useful to you.

Fitted in seconds.

Our Modem is as easy to fit as it is to use. One end slots into your Commodore 64's cartridge port the other plugs into your telephone line.*

Computer Pals.

Once you've installed a Modem you can communicate with all other Commodore 64 Modem owners.

You can leave messages on bulletin boards, sell and swap programs.

You could work together on programs. Discuss recent software releases. And even play chess.

Now you see it.

You'll be able to see page after page of information from existing systems like Prestel, Microsoft[†] and the exciting new system called Compunet.

Compunet, it's new and unique.

At present Compunet's exclusively for Commodore 64 Modem owners.

It's the most advanced communications system designed for home computer users.

At last you can work hand-in-hand with a giant mainframe.

Because you can send and receive information. This increased interactivity brings the capacity of large computers into your home.

Software galore.

And a lot of it's free. Free games, free education, free information.

Free from basic too.

Because you can now select software from Compunet then save it on to cassette or disk.

What's more, highly priced software from leading companies is on offer, thanks to our Modem's built in security systems.

You'll also be able to pick up useful hints and tips to improve programming skills.

Free tuition.

Now your computer can make a serious contribution to your children's education.

Already Compunet has over 50 free educational packages, with subjects ranging from elementary maths to A-level Physics. And there's up to 10 new packages every month.

Our Modem delivers the goods.

You can already shop via Compunet and make great savings by joining Compunetcard.

Before long, you will be able to view new property lists, order groceries, organise your banking and even request insurance quotes.

All in addition to a wide range of services currently available through other systems.

Free for all.

If you order a Modem now you will receive one year's free subscription to Compunet.

Representing a saving of £20.

Add to this the reductions you can get on many purchases through Compunet and you can see the obvious value of owning a Modem.

What price the world at your fingertips?

A Modem costs much the same as 10 albums.

Or, to be precise £9999.

Which is money well spent, because a Modem continually revitalises your computer. Making the Commodore 64 a home computer that should never lose its appeal.

You may find our Modems in the shops, if you're very quick.

Alternatively you can avoid disappointment and buy direct from Commodore. Simply complete the coupon, then we'll send you a Modem, plus your year's free subscription to Compunet.

Basic error

I TRIED your Pokes as
described in the August
edition of the magazine for
moving the bottom of Basic
up on the CBMB. Even with
these Pokes, I found as Joe
Morrow did, that either RUN
or NEW produced a
SYNTAX ERROR message.

On inspection of the Basic
RAM without the Pokes, I
discovered that address 2655
contained zero. I therefore
Poked zero into the first
address of the Basic area after
moving the bottom of Basic
up with your Pokes, then
loaded in the Basic program
and the SYNTAX ERROR
message was no longer
produced.

I can only think that if the
first line number of a
program can be contained in
1 byte, the first byte of the
Basic area is not zero-filled,

but shipped zero. I don't
have a RAM disassembler, so
I cannot check the accuracy
of this guess.

I trust you find this
information useful and
perhaps pass it on to Joe
Morrow if she is still having
problems.

Chart toppers

AS SUGGESTED by Ben
Arnosonich and Dee Lakha,
could you include a chart of
the bestselling Commodore
games in your excellent
magazine?

Also, could you sponsor a
high-score spot in
somehow? I'll start by
giving my scores — 426990 on
Berings of the Mistral
Cannet, 116200 on Beach
Head.

Jon Davies
Riverside
Mid-Glamorgan
CAN anyone beat these
scores?

Kuhn Lin conquered

I HAVE just read Pete
Gerrard's article on the US
Gold game *Beach Head* in
September's *Magazine*. I see
that he did not succeed in
destroying the fortress of
Kuhn Lin.

He obviously hasn't
practiced enough! I eventually
gained success, the result
being that the mighty cannon
blows apart and a white flag
appears at the top waving.
Alan Williams
Oxford
Wales

...and again!

ON Pitapat's keyboard
might very well hold the
secret to cross the road!
Clare: Try being wain't! Look
out for Madhouse!

Modem mania mounts

WITH COMODORE'S Commodore Modem officially launched at the PCW show last month, several other companies have entered the modem market.

Protek's 1200 modem is a standard RS232 device costing £29.95. An interface cable costing £14.95 is needed for use with the 64. The software incorporates error-handling routines and 100/1200 or 1200/75 baud rate selection. Protek and the subsidiary Microcom service can be accessed using the modem, but the question of downloading software and accessing Compaq has not yet been resolved.

Contact Citic Holdings, Park Lane, Brookmans, Herts, 000-444111.

Meanwhile Thorn EMI Datacom has announced the VS415 modem, initially for Apple and IBM computers, but with versions for home micros to follow. Contact The Sales Dept, Data Communications Division, Thorn EMI Datacom, Spur Road, Feltham, Middlesex, 01-890 1477.

Finally, Inadex's 2000/Y21 modem for the 64 or V10 20 is a 280 baud device supplied with software enabling the modem to be used as a "dumb" terminal. The unit is not compatible with Protek, and does not have Telecom approval. Cost is £49.50. Contact Inadex, Unit C2, Palscham Industrial Estate, 8-10 Crookley, London SW8, tel. 01-849 9947.

Protek's 1200 modem

64 music – the key of life

MUSICAL 64 owners will be pleased to see the release of a clip-on mechanical keyboard overlay for the machine. Commodore's Music Maker will cost £29.95. The system will include the keyboard, which sits over the top two rows of CYBERBIT keys, keyboard stickers, cassette or disk software, and a music book.

Further software and book releases are planned. The initial program will allow sound synthesis using most of the facilities of the SID chip; programming of rhythms and melodies; and instructional functions.

Music Maker will be available at the end of October, and we plan to carry a full review

in next month's issue.

A Commodore spokesman at the PCW show spoke of the possibilities of further 64 music developments which might allow connection of the micro to other units, such as synthesizers and drum machines using the MIDI standard, though no firm details could be given at this stage.

Music Maker – clip-on keyboard with a range of software

Quicksilver attack

QUICKSILVER launched a massive assault on the Christmas games market on September 18, with a press conference attended by press-clerical aides and Charles-and-GN lookalikes.

The Mighty Tharg, also editor of sci-fi comic 2000 AD, was there to oversee the launch of *Stratagem Dog* and the *Death Gunmetal*. Johnny Alpha, the Stratagem Dog, is a mutant heavily featured in regular adventures in 2000 AD. The 64 game, one of a projected series, will cost £7.95.

3-D Jet Attack, which has sold 50,000 copies in its Spectrum version, has now been adapted for the 64. It features a revolutionary half-solid perspective graphics system, depicting a mysterious city which you have to explore in order to save your beloved from marauding giant ants. Price again will be £7.95.

See Sam in from the Bangorian Andromeda team,

and in a strategy/tactics game in which you have to breach the defenses of a castle — £7.95 again.

Magic Mirror Mission is two games in one based on the opening credits of the Central TV series. In the first game you must land on an alien planet protected by robots, and in the

second you must penetrate the Magic Mirror to carry out repairs to its maze-like interior. £7.95 again.

Disk-based software includes *Dragons of the Castle of Icecream*. Both games, costing £12.95, are real-time interactive arcade adventures in which the hero, Norman the Warrior, is drawn deeper into the myths of the story as the game proceeds. The games are imported from Accelerated Software of Canada.

Breakin', an art utility program utilizing either joystick or keyboard, costs £34.95.

Finally, there's *Summer Games*, from Eggs 58, an Olympic simulation which stretches the graphics capabilities of the 64 to the limit. See the games section (p12) for a full review.

Reviews of the other games will follow soon.

Contact Quicksilver at 11 Fulcrumton Road, Southampton.

Summer' – 3-D Jet Attack alpha

Virgin Games — who dares wins

VIRGIN Games will release a program based on cartoon hero *Star Wars* in the spring of next year.

The program is intended for the Commodore 64, as well as the Amstrad and MSX machines.

Don Dore, space-pilot hero of the Eagle comic, has recently become fashionable all over again with the release of Eagle by IPC and the reprinting

of many of Dore's early adventures in book form by Dragon's Dream Press.

The Virgin game will probably be a multi-screen arcade adventure done in comic-book style, with speech bubbles. As the amount of details are available as to the price or title of the game, but negotiations for copyright have been completed. More details will be made available soon.

Practicorp thinks ahead

PRACTICORP, producer of the PS Programmable Spreadsheet and 64 Doctor programs reviewed in previous issues, has announced plans for its next batch of releases.

The new programs include business and educational packages. PracticFile is an adaptation from a successful microcomputer version. Inventory 64 and PractiCalc 1 are also on the way, and on the

educational games from there's 64 Psk, Tap Tutor, Zappin! Names and Sprint Typin. Total Health sounds like a version of 64 Doctor designed for human beings.

Full details of price and availability will be released shortly. Practicorp can now be contacted at Goldend Road, Whitehouse Industrial Estate, Ipswich, Suffolk, IP1 3MP, phone 0473-661721.

Practicorp's full storage

RS232 access eased

ACCESS Computer Co. of Stockport has developed a combined Serial Interface and cable, allowing connection of RS232 printers to Commodore computers.

The £34.95 unit is supplied with simple instructions and allows the Epson 8000, P7000 and FX100 printers to be used, along with many other models including Star, Shiva, Oki, Brother EP844, and Silver Reed printers.

Contact The Computer Centre, 81 Shaw Heath, Stockport, Cheshire, 061-477 6001.

Access' connector

Hugh's artistic winner

THE RESULTS of Commodore's International Art Competition were announced at a show at the Hayward Gallery on September 3.

The winner of the competition, which required entrants to create a still or dynamic work of art on a 64 or Vtc 2B, was Hugh Riley of Manchester. Hugh won a £5000 endorsement to study computer art in the country of his choice, plus £1500 worth of Commodore computer equipment.

The winning piece was a study of Hugh's baby son entitled "Louis (Meditation Before 120)".

Prize-winners in other age groups and categories included Evan Williams of Newcastle, Richard Hatfield of Hendry-on-Thames, Graeme Ross of Aberdeen and Joanne Delaney of Blackpool.

Hugh Riley and his winning program

Stay cool. Stay low. Stay alive.

RIVER RAID

1-2 Players. Burning on
Commodore 64, Sinclair Spectrum
from your local software store.

You are commanding a squadron of four ground attack aircraft...

The mission is seemingly hopeless.

Ry along the river at zero altitude, twisting and turning coastly to stay within its tortuous banks, blasting at anything and everything in sight. Especially the bridges.

Three of your jets are held in reserve while you are pitched against Battleships, Enemy Aircraft, Land Tanks, Balloons, Helicopter Gunships. All intent only on your destruction.

And destroy you they will, if you don't get them first. You'll need to keep an eye on your fuel gauge. But take comfort, you can take fuel on board from one of the special depots.

If you get hit—and nobody has yet reached the end of the river—your next reserve starts at the last bridge you blasted on your way through!

Each target you destroy adds to your points score.

Like all Activision Software, River Raid will hold you and keep you coming back for more.

Choos! away!

Lose yourself in the world of

 **ACTIVISION**

Plus/4 — the verdict!

COMMODORE's new 64K machine is now making an entrance to the home micro arena where its predecessor has been so successful. So, how does it compare to the 64?

The first thing that strikes you about the Plus/4 is the size — or rather the lack of it! Instead of that rather cumbersome rounded box inherited from the VIC-20, the Plus/4 features a much smaller and neater MSX-style wedge-shaped design, which is far more visually attractive and places the keyboard closer to the desk top. The top section of the top provides ribbed ventilation slots and the unit remained cool indefinitely.

The appearance of the white keyboard is rather similar to that on the portable 524, but the key-caps are comfortably dished. It may not be quite as acceptable to some users as the 64's, as the keys are heavily spring-loaded and rather 'bouncy', but each feature a rather a matter of personal taste. In a departure from Commodore tradition the cursor keys are placed away from the main keyboard in a diamond formation at the bottom right corner of the case, which makes cursor control much easier. Four dual-purpose FUNCTION KEYS are placed in a horizontal row at the top left of the keyboard.

Warm start

A power on light and switch are provided, together with a RESET button. The RESET key normally acts in the same way as the power switch, giving a straight

forward cold start, but if the RUN STOP key is pressed during RESET a warm start to the machine under monitor is made instead so you can often reinsert programs which 'hang-up'. We feel that this sequence should really have been reserved for a warm start by pressing the RESET key alone, as it is rather too easy to accidentally produce an unwanted cold start.

All the I/O connectors are placed neatly along the back of the machine. The SERIAL (for disk drives and printers), VIDEO (for monitors), and TV sockets are identical to those on the 64, but the cassette port, user port, and joystick ports are all totally different, using small 8-pin plugs. Three socket changes are initiating as the standard CIN cassette recorder and joystick cannot be plugged in. The power supply is the familiar 'bump' provided with

the 64, but with a different connector. An interesting inclusion in the row of sockets is a MEMORY EXPANSION port, providing even greater storage capacity, but there is no separate cartridge port and 64 cartridges are incompatible, as the connection differs. As usual on Commodore machines, the serial I/O does not use the industry standard RS232C voltage levels so an interface will be required for non-Commodore peripherals, and communications.

Memory switching

On power-up 'COMMODORE BASIC V3.1 (68K) BYTES FREE!' appears at the top of the screen. The version number is a reflection of the improvements made to the BASIC since the 64's V2 and the 68071 bytes of memory directly available through BASIC is a whole 21760 bytes (21K) more than that termed 'displayable' on the 64. Although both machines have 64K of RAM this increase in availability is achieved by some neat automatic memory switching routines (and we can't wait to see if Commodore's TV ad's will now feature a bit whaled).

The Plus/4 retains the full screen editing facilities of the 64 but adds some useful extras, such as automatic insert and blank characters, and the editor is easier to operate with the new cursor key arrangement. In usual Commodore fashion a wealth of different graphics characters are printed on the fronts of the keys but these are not obviously re-definable.

To keep up with the times a WINDOW facility has been included, although this is rather rudimentary, providing only a single window via ESCape sequences. The top right and bottom left corners of the window must be defined in terms of current cursor position, so including window settings in programs is rather messy. Other ESC facilities include automatic insert, deletion of a whole line, turn off scrolling, redoes screen display (which may be necessary on some TVs), and scroll up and down.

The default settings of the function keys provide one-key entry of "GRAPHIC" (F1), "LOAD" (F2), "DIRECTORY" (F3), "SEARCH" (F4), "DELETE" (F5), "RUN" (F6), "LIST" (F7) and "HELP" (F8) and in contrast to the situation on the 64 the function keys can easily be redefined using the KEY command. The useful HELP facility assists in debugging BASIC programs. If an error comes in light during execution then pressing HELP displays the appropriate line with the relevant section highlighted as flashing characters. Entering LIST and then calling for HELP will feature the error in context.

Slow loading

The draft manual suggests that the cassette routines are slower to those of the 64, so we suspect that it may still suffer the same problem of slow loading.

The Plus4 operates perfectly with the 1541 Disk Drive, but inevitably it suffers from the notoriously slow access time of this unit. The 1541 is to be replaced by the 1541 which promises faster execution times. The commands supplied on the 1541 demo diskette (for the 64) are not required on the Plus4, as the disk handling commands are all included in the IIC ROM. These disk commands comprise BASIC, LOAD, DIRECTORY, BACKUP, COPY, COLLECT, RENAME, SCRATCH and HEADER, with 'DOS' provided to trans-

fer any disk handling errors.

BASIC V3.2 is a marked improvement on the first old BASIC V2, as Commodore has taken to heart the numerous complaints from users and included many of the better features of more modern BASICs. All commands available on the 64 are included together with a number of significant additions. Commands can be abbreviated (and of course you can program the function keys to duplicate any desired sequence).

The extra non-graphic and sound commands are as follows. AUTO provides automatic line numbering while DELETE removes program lines on request. Although Commodore has not gone the whole hog and provided a completely structured BASIC the addition of DO/LOOP/WHILE /UNTIL/EXIT should go a long way towards appeasing the purists. BASIC 3.2 supports IF ... THEN ... ELSE rather than just the simple IF ... THEN, which makes for index-programming. Modification to STORE now allows a line number to be specified from which to read DATA. Extensive error-trapping routines are included to make total program crashes, available. TRAP traps all error conditions except "UNDEF'D STATEMENT ERROR", and will retrace the program to a predefined line. Once an error has been TRAPPED the guilty line number can be traced from the variable \$L, with the error condition con-

tained in the ER variable. The function ERRERR gives you the error message corresponding to ER.

RESUME allows you to continue' program execution after an error has been trapped. GOTO is a GET (or INPUT) statement which automatically waits for a key to be pressed instead of falling through. HEX\$ converts from decimal to hexadecimal numbers while DEC provides the reverse conversion. The JOY function returns the value of a switch type joystick, but the industry standard 5 way D plug is not used! PRINT USING allows formatted PRINT output (such as columns of figures) to be produced with the minimum of effort, and PDEF allows you to define the characters to be used in PRINT USING. INSTR is a valuable addition to

the string handling commands providing searching for one string within another. TROM and TROFF are debugging commands which print the current line number on the screen during program execution, although these commands are often more trouble than they are worth as they open the screen display.

The graphics commands are a strong point of BASIC V3.2 as they transform graphics programming from an occult art to child's play. The SLD and VIC

Software on trial

THE PLUS4 has been designed as a market leading computer system intended to maintain and, if possible, improve Commodore's prominent market position. An integral part of the system is a software package provided with the machine and held on ROM for near instant use.

Named 3-PLUS-1, the software provides facilities for word-processing, records filing, spreadsheet operations, and creation of simple graphs. The package is not a sophisticated one and does not offer the facilities of most dedicated programs in each of these fields. However, this is the first time that such a package has been made available for a mass-production computer aimed at the home or business user at this price.

So called integrated software packages are the fashion at the moment in the highly competitive market of business software for machines such as the IBM PC. Commodore has achieved several points in the integration stakes. The 3-PLUS-1 software is integrated into the machine itself, the programs share many of the same commands, data can be transferred from

one program to another; facilities from two or more of the programs can be combined to do things like creating mail-shots; and the programs with data can all be 'saved' on the machine at one time.

When you switch on 3-PLUS-1 you are started off in the word processor. The working area available to you is 77 characters wide by 99 lines deep. Most of the standard facilities are provided including text entry from the keyboard (obviously), deletion and insertion of text at any point on the work area, copying or moving blocks of text, text formatting through the use of tabulation settings, word-wrapping (so automatically ensure that words are not split at the end of lines), justification by spacing words to completely fill lines, and control of the printed output.

In practical terms the documents which can be produced must be relatively short. Letters can be produced and, when used in combination with the data-base, circulars or mail-shots are possible. It would be over-ambitious to attempt to write books or lengthy articles.

A major restriction on the software is the way that the screen display is used. Only 13 characters are shown across the screen, and this means that a little less than half the width of the document is visible at any one time. This makes reading the document difficult as you must pass through the thing from one side to the other to follow a sentence through. Also it makes it difficult to plan out the format of the final document. A phrase often used to describe some word processors is "what you see is what you get", meaning that the display on the screen can be set to show the document just as it will appear when printed out. No way can 3-PLUS-1 provide this.

On using the word processor I found a number of things not to my taste. The commands are generally rather clumsy in use, for example there is no text insert mode. You must use the INSERT=DEL key to give you a series of spaces or a special command to insert a blank line and then type in the space provided. Hitting the RETURN key can wipe out a whole line of text if you are not careful. When working with blocks of text, the text is not obviously marked on screen and hence it is easy to make mistakes.

The second program given is a

spreadsheet. This is my least favourite program of the four. The principal of a spreadsheet is to provide a grid into which numbers, formulas, and text can be placed and manipulated. The value of a spreadsheet comes from the ease of setting the thing up or modifying data and, for many practical applications, the size of the grid provided. Commodore has had to cut some corners with this program in terms of the way in which formulas are provided and the size of the spreadsheet grid.

A grid of 50 rows and 17 columns is provided, which is adequate for many uses, but an additional limitation is imposed by the memory allocation (around 7k) to allow the other programs space in memory at the same time) which can mean that only half the grid spaces can actually be filled. The screen display is normally set to show 12 rows and 5 columns. A half-height display is also used, 7 rows deep, to permit both word processing and spreadsheets to be shown on the same screen.

Each space, or cell, on the grid may contain a number and may also contain text or a formula. Any formula may contain references to other cells, either explicitly by the cell row and column numbers or by the row label on the cell. It is here that Commodore has chosen to ignore most of the other spreadsheets by using an unusual method of referring to cells by row/column and using numbers for the column

reference. It is more normal to refer to systems/rows using letters to signify the system. Also, to make it easy to build up the spreadsheet, a function is usually included which copies a single formula into a number of other cells which automatically corrects the formula for each cell. Commodore has not provided such a function.

Data from a single row of the spreadsheet can be used to create a simple bar graph and transferred to the word processor. No competition to Lotus 123, but even simple graphs can have their uses.

Graphs are produced in low-resolution to allow printing directly to standard printers. Automatic scaling is used to produce a graph 50 characters high but the scaling cannot accommodate negative values.

Last and not the least, another useful feature is a data-base program. Once again the program is relatively unimpressive, but is very functional despite this. However the program cannot be used without a disk drive.

Up to 999 records (think of each record as a card in an index file) can be set up to form a file on a disk. Once set up, the records can be modified, sorted, specific data can be searched out, and the records can be used to provide data for use with the word processor.

The most difficult operation is the initial setting up of the data file. You must specify

what type of data is required on each record, and how much space must be provided for each item of data. This information cannot be changed once set up and so you must be sure of exactly what you want before you start to set up the data. After doing this, the rest is relatively easy. Alphabetical sorting is reasonably fast, as is searching the whole file for a particular item of data.

All the 3-PLUS-1 programs are designed to be used with a disk drive. This obviously will increase the cost of a full system. The data-base is dependent on a disk drive to work at all.

A separate manual is provided for 3-PLUS-1. This provides a tutorial approach to introducing the programs, as well as reference outlines. Each function is individually described with the help of examples.

In summary, if you are thinking of getting a PLUS/4 just for the sake of the software, then forget it. You can get much better value elsewhere. As an addition to a potentially good general purpose microcomputer it is of some value. If you want to learn the basics of using these types of archetypal programs, but have no immediate grand plans for their use, then the PLUS/4 system is well worth further investigation. ■

John Cochrane

chips of the set have disappeared into obscurity but all that tedious FORKING is a thing of the past, having been replaced by a graphics screen comparable to that of the Microsoft Extended Color Basic used by the Tandy CoCo. Dragon and new MSX machines.

Five different GRAPHICS modes can be set up. The default mode 0 provides a standard 15 line by 40 column text display, but selection of one of the 54-res modes increases 10k of RAM. Mode 1 provides a full-screen 120 x 200 pixel display with the full range of colours (subject to the restriction of only one foreground colour per character square), whilst mode 5 halves the horizontal resolution but allows three foreground colours in each character space.

Split screen

Modes 2 and 4 are similar to modes 1 and 5, except that the screen is split and retains five lines for text at the bottom. CHAR

allows you to print a string of characters anywhere in any mode, providing useful integration of text and hi-res graphics. COLOR assigns any of 16 colours and 8 luminance settings to either the background, any of up to three foregrounds, or the border. BOX allows you to draw filled and empty boxes, which can be rotated about their corners, and the very powerful CIRCLE command allows you to draw anything from a simple circle, through ellipses to a triangle inclined at 45 degrees. DRAW produces a straight line between two points and can be used to produce a whole shape (although not as simply as with the Microsoft DRAW command).

LOCATE places the cursor at any screen coordinates and SCROLL allows the screen coordinates scale to be changed. PRINT fills defined parts of the screen with particular colours. SHAPE and GRAPH are alternatives of the screen to be picked up and moved, but as the information is stored in a

string rather than an array the size of the area taken is much more restricted than with the similar Microsoft GET and PUT commands. The RIGHT function provides the X and Y coordinates of the cursor and can also return what is beneath the cursor. SCR returns the current graphics mode, and SLOW the luminance level of a specified colour. All the graphics commands can be specified in absolute terms or relative to the cursor.

Sprite capability

One excellent feature of the 64 which has gone is the sprite capability — although dealing with sprites was so painful that most people never bothered with them anyway! Consideration of the standard of sprite graphics currently being produced on the humble Spectrum leads us to believe that expert game programmers will not find this too much of an obstacle.

Second on the Plus/4 is a pale shadow

And you thought
it was just a movie!
Coming soon to save the computer world!

ACTIVISION
Your computer was made for us.

compared with the brilliant effects possible on the 64, but once again it is much easier to access and it still puts many other home video to shame. The sound is routed through the TV speaker, and is controlled internally via the VOLUME command which provides seven levels (with a default level of zero — which is why we began to wonder whether the sound channel on our monitor was working!).

White noise

SOUND controls the two voices available, the second of which can produce both tones and white noise. Flowsops are not supported and only the voice, tone, and duration of the note can be specified, although Commodore do give a table of musical note conversions (which regrettably require obscure values).

Although SED and VIC may be dead TED has arrived, in the form of the built-in TRIDROM which provides a straight-forward assembler, disassembler and machine code monitor (which is inevitably somewhat limited in its scope, although adequate for dealing with small sections of code). The only feature worth noting is a trace facility, allowing you to step through your program watching fan bugs, however, instant access is definitely a plus point which should lead more users to widen their programming experience into machine code.

Although the Plus/4 is now ready for launch in the UK, Commodore has been dragging its heels somewhat, because of delays in completion of the built-in software packages, so it will be the new year

before it is available in volume. There has been much speculation over the marketing positioning of the Plus/4 and the 64 because they are both in roughly the same price band. Although many people expected that the Plus/4 would be simply a replacement for the 64, it is becoming apparent that this is not true, and that Commodore is aiming at rather different types of user.

Commodore sees the 64 continuing as essentially a games machine, with the Plus/4 appealing more to the "serious" home user, who is interested in programming. The Plus/4 has the newer 7901 CPU in place of the 6118, but any increase in

speed this brings is offset up to the extension to BASIC and memory switching, so running the standard PCW benchmarks on both machines produced effectively the same times. The Plus/4 User Guide was seen only in draft form, but promised to be an improvement on the 64 User Guide, as it contained much of the useful information previously restricted to the Programmer Reference Guide.

Our overall impression of the Plus/4 was that it was well constructed, more user-oriented, and a marked improvement over the 64 in many other respects. The price of £300 seems rather steep (as production costs cannot be much different from those of the 64), but some allowance must be made for the free software. It is possible that Commodore is deliberately inflating the price to clearly differentiate it from the 64, and leave room for manoeuvre — just remember how much the 64 cost when it was first announced.

Outside competition

Of the outside competition, the O1 and Amstrad have much faster BASIC, are technically more advanced, and seem to offer better value-for-money, although perhaps a small user-base in global terms. The MSX machines have a similar rate of speed, offer compatibility, but are rather an unknown quantity. How will the Plus/4 fare against the competition will probably depend as much on brand-loyalty and availability as anything else. ■

Keith & Steven Brain

COMMODORE 64

OXFORD PASCAL

YOUR FUTURE WITH COMPUTERS DEPENDS ON PASCAL

KEY FEATURES

- PASCAL is the world's most popular programming language after BASIC
- PASCAL is FAST... up to 20 times the speed of BASIC

WHAT IS OXFORD PASCAL?

OXFORD PASCAL is a COMPLETE implementation of the popular programming language PASCAL, running on the Commodore 64.

STANDARD SOUND

With the OXFORD enhanced to PASCAL, you can programme dazzling graphics and astounding sound.

WHY OXFORD?

With the cassette version of OXFORD PASCAL, you get:

- A powerful text editor for preparing PASCAL programs
- A resident compiler giving 10% of user RAM
- A powerful set of colour graphics and sound extensions to standard PASCAL

With the disk version of OXFORD PASCAL, you get:

- All the above, PLUS
- A full disk-to-disk compiler exploiting the entire memory of the 64 for PASCAL programs.

HOW MUCH DOES OXFORD PASCAL COST?

Cassette version (resident compiler only)	£14.95
Full disk computer (RAM, 4096, 1024)	
8000 drive	£49.95

Prices are exclusive of VAT. There is also a small charge for post and packing.

AFTER years of rumours about its death, the VIC20 is now officially obsolete, replaced by the Commodore C16.

The C16 comes in a starter pack, similar to the VIC, consisting of dedicated cassette deck, 'Introduction to BASIC', and four software packages, for £39.99. The 16 is the same robot to the total RAM available, though like the 64 the amount of user RAM is considerably less.

It looks just like any other Commodore machine, in the same case as its predecessors, though in a different colour scheme — the case is dark grey, and the keys light grey. The keyboard itself is the usual IBM type of thing, with decent keys, and angled, though the layout is non-standard, even compared to its predecessors. If you've got used to the positions of keys like *, =, HOME, and the all important cursor keys on the 64, then you will have great fun on a C16, as they're all changed round. I find IBM keyboards a little too soft, but typing is a personal thing.

Inside the front is a standard circuit board, leaving quite a bit of empty space. The American origin of the machine are immediately apparent by the metal screwing all over the circuit board. In the USA, there are certain legal requirements for radio interference, but there are no such laws in the UK, so British users usually

Commodore have killed that piece of the market stone dead, and made poor young Simon unemployed, as BASIC version 3.5 is supplied with the machine, which has all the extra commands you would expect on any other machine.

The BASIC sits in 12K of RAM, along with the kernel, which looks after the whole machine, and a machine-code monitor. The BASIC is Microsoft's as you'd expect, but in the fancy Commodore dialect used before. Programs are edited using the same screen editor as before, but with the addition of a few welcome features such as automatic insert mode. The same PET-type graphics characters are available, and the function keys are initially configured to produce various key sequences. The default

'window' commands. Windows are one of the things at the moment, and have appeared on the Amstrad and QL, and now the C16. However, you can have only one window at a time, so it's not really as good as the others mentioned. I believe a similar effect can be obtained on the C64 by POKEing away. Regrettably there is no WINDOW command, so the process of defining a window has to be done by a tedious sequence of control code printing.

The C16 has five graphics modes. The simplest is Text mode, with the usual 40 by 25 lines of text, with each letter able to be a different colour. This is the only one that doesn't take up the extra 10K of memory. In text mode, there are 15 different colours, each with 8 levels of luminance, and black, effectively giving 121 different shades, all

of which can be displayed at once. There are also two high-res modes, one with 4 lines of text at the bottom of the screen, and one without. It gives the resolution

Sweet little 16

drawn on the average robot in the same case. There are few components on it, the main ones being the 7801 processor and the custom chip that does the drive stuff like producing a TV display. The 7801 is just another Commodore version of the integrated 8502, like the 8513 in the 64.

On the C64, with its 64K of memory, when you switch on you get a message saying something like '16K bytes free'. The remaining 16K is used up by the system, so about 40% is unavailable in BASIC. On the C16, with 16K RAM, you get about 12K free, which isn't bad. However, the moment you select one of the high-res graphics modes, another 10K of memory goes down the tube, leaving you under 2K user RAM, less even than the VIC20. This is the major shortcoming of the C16 — the lack of RAM. On the 16K Spectrum, about 8K is left to the user, which is quite ample for many uses, but designing a 10K screen for a machine that has only 16K is a major oversight by Commodore. It's supposed to be technically possible to expand it up to a Plus/4 and onwards to 655K, but Commodore don't have any plans for doing this themselves yet.

Previous hallmark

It has been the hallmark of previous IBM machines that the BASIC dialect support any of the machine's nice features, such as graphics and sound. It practically made it a necessity to fire one of the many 'extended BASICs', either Simon's BASIC from Commodore themselves, or one of the independent programs. Well, on the C16

commands are a little strange, being mainly concerned with the disk drive, and as most users would not have a disk drive, but the supplied cassette recorder, they seem an odd choice. Anyway, if you don't like them, the KEY command re-defines them to be anything else — no POKEs necessary on the C16. For entering programs there are a few other commands, like AUTO and BBNL4, which are again new to IBM users. Fans of 'structured programming' will not be impressed, its only such features being DO, WHILE and DO UNTIL, with no procedures or loop functions.

By pressing the ESC key followed by another, various extra functions can be invoked, the most interesting of which are

is 300 by 200, which is about average nowadays, though there is a colour restriction — you can only have two colours in one 8x8 pixel character square, the same as the Spectrum. However, you can still have 121 different colours at once. The two remaining modes are 'multi-colour' modes, which have a resolution of 160 by 200, but can have up to four different colours per character square, still with the choice of 121 colours.

Missing feature

The main feature missing on the C16 compared with the 64 is sprites. Undoubtedly the best feature of the 64, they made it much easier and faster to write

games, as the programmer didn't have to bother about the mechanics of actually putting shapes onto the screen and removing them later, since the hardware did it all. The omission of sprites on the C16 is a real loss, and it may make it harder to write quality games for it. The Spectrum programs show that graphics problems can be overcome by skillful software, but it takes a few years to work it out. How fast it will be worked out as the C16 remains to be seen.

Graphics control

Controlling the graphics from BASIC is easy, with commands like DRAW, LOCATE, BOX, CIRCLE and PAINT. The Circle command doesn't just draw circles, but can produce arcs, arcs, or any kind of polygon. The CHAR command is a sort of PRINT AT command, that works in any graphics mode, and PAINT is a way of filling in areas with solid colours. The speed of the graphics generally, and especially the filling, is positively snail-like, and the BASIC itself is a little slower than previous Commodore dialects.

The sound facilities of the C16 are not half as good as the 64s, but are more than adequate. There are two voices, one for notes, and one for notes or noise, with overall volume control. It may have more features, but they are not accessible from BASIC, and as the Programmers Reference Guide has not yet appeared, I can't say. As it gets piped through the TV, volume is not a problem.

The built-in machine-only monitor is not earth-shattering but it's better than

nothing. It has a one line assembler, disassembler, and various memory read and write modes, though it doesn't have single stepping. It seems to have only one &A; load commands via the cassette recorder (and not disk), but I can't be sure as I had no instructions at all for the monitor.

The C16 comes with its own dedicated cassette recorder, which seems to be the same as the usual one, except that it has a different plug. The tape format is similar to Intellivision, so the market for cassette loaders remains for the C16. It also connects to the notoriously slow 1541 disk drive, but also supports a new disk drive, said to be four times faster. The BASIC has various commands to control the disk drive, including various backup procedures, and a DIRECTORY command, and this latter feature is innovative on a Commodore.

As with Sinclair's QL, the 'joystick' sockets on the C16 are something of a con by Commodore. Instead of the usual Atari-type sockets, it is cursed with two strange-looking mini-DIN type sockets, so you

can't actually plug anything into them except Commodore's own forthcoming 'super joystick'. They aren't much different to the normal joystick-to-cable switched ones, so putting analogue sockets on the C16 seems to be just a way of selling more joysticks.

The documentation supplied with the review machine was very much pro-Commodore, consisting of a couple of hand-drawn photocopied sheets. What was there was good, though some of the things were inaccurate. The C16 will be supplied in a 'starter pack' with four cassettes, but these too were unavailable for review.

The C16 is basically a VICE20 with a better display and more RAM, though when using graphics a similar amount is left to the user. It compares directly with the 48K Spectrum and the Cric. Its advantages include the supplied cassette recorder, good keyboard and better graphics, while its disadvantages are the small amount of RAM and uncertain software support. Conversions from the C64 are going to take time, because of the lack of sprites and minimal user RAM, though VIC conversions will be easier. It can in no way be thought of as a replacement for the 64, though if it had 128K RAM more than it would be a certain blockbuster. As it stands it does not have enough RAM for much programming, though Commodore's marketing muscle will probably ensure that a lot of C16s will find their way into Sainsbury's this year. ■

CLIFF HANGER

AUTHOR - JAMES DAY ORIGINAL MUSIC - BRIAN COE

Thrill to the cartoon style action of Cliff Hanger, a really original Wild West game. As Cliff the hero, you've got to stop the bandits shooting up the canyon. But with its own brand of wacky cartoon action fun, things simply aren't as they seem in Cliff Hanger. For a start, the boulder you throw at the ol' bandits may just come bouncing back at you.

Cliff Hanger incorporates all the elements that have made New Generation games best sellers for the Spectrum, such as original ideas, superb graphics and hilarious happenings - but now it's available first for the Commodore 64. Featuring 30 separate screens, three levels of difficulty, one or two players scoring, Hall of fame and joystick compatibility or user defined keys, Cliff Hanger is set to be THE Commodore game playing sensation. Available from any good software store for just £7.95.

Shoot the Rapids

AUTHOR - PAUL BLINN

Ever wondered what it would be like to face the fierce white water in a top class canoeist slalom run? Well wonder no more because you can enjoy the fast action thrill of competitive canoeing from the comfort of your own armchair with *Shoot the Rapids*.

It's a game that involves real skill because you must move your joystick to simulate paddling action. You must get through the gates of the slalom course in the fastest time possible, while avoiding the river bank and rocks. There are also extra hazards like rogue speed boats and interfering beavers to worry about.

This multi level game features increasingly difficult river courses with superb graphics and smooth scrolling along the river. Qualifying times have to be reached to move onto the next course.

With Hall of Fame, one or two player scoring and joystick compatibility, *Shoot the Rapids* is probably the best sports action simulation game devised to date. Available from any good software store for just £7.95.

Some useful DATA for the 1520

16-year-old Sarah Cotton tackles some problems she's encountered in using the 1520 printer/plotter and the use of DATA statements in programming

THE 1520 printer/plotter, for use with the Commodore 64 or VIC-20, is one of the cheapest and most versatile of the Commodore machines, chiefly directed at the home user market. In this article I have aimed to explain how to set about using it in as simple a way as possible.

It is assumed throughout that the printer is set at device 4 although some may be at device 6. If you experience any "device not present" errors try setting the middle number of the OPEN statements to 6.

Simple

Let's begin with a simple program which will get the printer/plotter to write out your name. First remember to turn your 1520 on, and check that the pens are correctly inserted.

Run the program to assure yourself that it works.

Line 10 tells the computer that you want to talk to the 1520, indicated by the "device number" which is called the "file number". The first number is the "file number" which can be anything from 1 to 127. The final digit tells the computer the particular task you want this file to do — here the 0 tells it that you want to print characters.

When you refer to file 1 again in line 40 the computer knows that this file is to be used for printing characters and not soundeffects.

Line 20 finishes the program by closing the file.

Let us develop our original program by adding the lines in Program 2.

Line 11 opens up another file, this time called 2. The final 1 tells the computer that it is to be used for changing colours.

Line 21 actually performs this task. The 2 tells the computer we want to change the pen colour, and 1 is the code number of blue. The numbers for the other colours are given in the 1520 manual.

File numbers

Try changing the file numbers in the program and check that you understand the principles of using them. Remember that you will also have to change the numbers in the PRINT statements.

You can improve and alter the way the printer writes out your name. Change the character size by adding the lines in Program 3.

The numbers for the other character sizes are given in the manual.

Program 1

```
10 OPEN1,4,0
40 PRINT#1,"YOUR NAME"
50 CLOSE1
```

Program 2

```
20 OPEN3,4,3
30 PRINT#3,"2"
70 CLOSE3
```

Program 3

```
15 OPEN2,4,2
25 PRINT#2,"1"
60 CLOSE2
```

Program 4

```
OPEN10,4,0
CND10
LIST
CLOSE10
```

With a little help from the manual you could change to lower case (OPEN 4,4,0 PRINT "L,";"") or rotate the characters (OPEN 4,4,0 PRINT "L,";""). Don't forget to close the files at the end of the program.

Listings

Let's say you have just written an exciting and original game for Commodore Amibrose and now want to get a copy on paper: what do you do? Listing out programs on the printer is easy, although not exactly fast especially if they are really long. But do not despair — the quality is very good.

Write or load up a program into your computer and then type in the lines in program 4. Unfortunately the 1520 cannot print out the normal control characters used by the computer — it has its own special characters. These are shown in the manual.

Due to the 1520's plotting capabilities, you can think of the paper in your printer as a piece of graph paper. When you switch it on the origin, 0,0 is at the position where the pen stops. See figure 5.

From the origin you can go up 999 steps, down 999 and across 480, each step being 1/5 mm. Points are given using (x,y) co-ordinates relative to the origin. Type in and try program 5.

Obviously you will want to draw much higher pictures, but you could find yourself coming off the top of the paper. You can overcome this in two ways — either by using the paper feed before running the program or, much better, by actually including a line to do this. Try program 6.

Notice that if you change the position of the origin you have to use prin "N,";"R" to move and "J" to draw.

The coordinates in both of the programs were held in data statements, but this is not the only method for plotting. If you want to draw the graph of $y = x + 10$ the program will take this sort of shape:

Open files. Move pen down paper.
For X = 1 to 400 Y = X + 10 Draw to (X,Y)
Next X
Close files.

You will notice that many of the 1520 programs I've given involve the use of DATA statements. Let's go on now to look at this useful programming aid, which has applications in many types of programs including those requiring control of word, graphics and string handling.

DATA statements

The data statement, along with the related terms of 'Restore' and 'Read', is one of the most versatile parts of Basic. It is used when several unrelated numbers or words are required to be held in the program, and including them directly into variables is not efficient or feasible.

This short program number 7 should help you to understand how the three commands work.

Line 10 looks at the numbers and the word in the DATA statement, and places each in a separate variable. ■

Program 3

```
10 OPEN11,4,1:REM OPEN PLOTTING FILE
20 PRINT#11,"H":REM MOVE TO ORIGIN
30 PRINT#11,"M":0,20:REM MOVE TO POSITIO

Diagram 1

Line 20 prints them out on the screen. Line 30 is added to tell the computer that when another READ statement appears it should start looking at the DATA statements from the beginning again.

DATA statements are almost essential in the playing of games, saving a lot of typing. Turn up your sound and try out program 8. 'A' and 'V' are loop variables, 'H' the score to be played and 'I' the duration.

You could try changing the notes or adding more by increasing the number in line 30. Notice that the "RESTORE" command is not needed as the numbers in the data statements only have to be read once.

One useful application for DATA statements is in keeping lists such as telephone directories.

Type in and run program 9 using both known and unknown names. When you are sure that it works you could put in the names and numbers of your friends.

DATA statements also become useful in handling graphics.

Nearly all the commercial games you have purchased will have included special graphics which are now designed using the PET graphics on the keyboard.

These characters are called "high resolution graphics". Using DATA statements you can live up your own games by designing your own hi-res graphics for use in your programs.

If you don't have a graphics or sprite design program you'll have to begin with an 8x8 grid drawn out on paper.

"Live'n up your games with hi-res"

Design your character by filling in the appropriate squares as I have done in diagram 1. Looking across columns left to right you can see that each one has a different number associated with it. These are binary numbers, and the filled-in blocks in your 8x8 grid represent "bits" of a "byte" which will control your graphic character. Add the numbers designated by the filled blocks, and when you have worked out all the figures you should be left with 8 numbers, which then should be placed in data statements such as these in program 10.

When you have run it by pressing "at", a little man will appear.

Design some of your own graphics and add them to the program. You will have to add it to the loop in line 30 for each one. The characters will start at "at" and then work through the alphabet.

If you assign the 'K' key to the printing of a graphic, then the letter 'K' will only appear in any words you may wish to display in your game program, if it is in reverse field. ■

The Potty Programmer

From *Alligata* to *Gremlin Graphics*, Tony Crowther has blazed a trail of original and highly playable games. *Chris Jenkins* pins down the man behind *Potty Pigeon* and *Monty Mole*

TONY CROWTHER says he wants to be famous, and he's going the right way about it. His games for Alligata and recently Gremlin Graphics have set new standards for playability, graphics and invention, and characters like *Monty Mole* and *Potty Pigeon* are following on from the success of the earlier *Blogger*, *Loose* and *Killer Watt*. But the financial rewards of being a programming mega-star bring with them the complications of contractual wheeling and dealing.

"I just don't get a penny for the games I write for Alligata — I signed a contract at Christmas, and in all the excitement I didn't realize that one of the clauses meant that I only get royalties for my Alligata games while I worked for the company. Now that I've moved to Gremlin Graphics I won't be getting anything."

Tony's programming career started in educational software — "I'd read a BBC in school, and bought myself a Vic and taught myself programming. This was when I was 16. I went through Basic programming and then taught myself machine code using cartridge-based assemblies — I couldn't work out what I was doing some of the time, but it was working!"

Monty Mole — potty underground!

Tony's first six games for Alligata — "I'm not proud of them!" — included *Bullseye Rescue*, *Damned in Doreen*, *Squash-a-Frog* and *Action Tank Adventure*.

"They were really crummy programs, Alligata's first releases, and when I wrote them I was working from home and getting a royalty, but later I went up to work there."

Tony's first big success was *Blogger*, using some of the ideas of *Monty Mole*. With Tony's distinctive style, however, *Blogger* came across as far more than an MM rip-off, though it was Alligata's idea to produce the game. "The programs I'm working on now are joint efforts between myself and Gremlin, who offered me £10,000 for *Potty the Potty Pigeon*. I wrote *Potty* in all the desperation of leaving Alligata, and Gremlin offered me a discount on the software as well as the advance on the game."

Secrets

Gremlin's managing director is Geoff Brown, who also runs Crowther's US-Gold. Geoff contacted Tony after seeing his Alligata games, and Tony, who was a regular at Gremlin's Sheffield computer shop last March, now works exclusively for Gremlin.

But just what is it about Tony Crowther games that makes them special? So far the distinctive large, colourful graphics and smooth scrolling effects have made such game sales to recognize as a Crowther effort — but as Tony explained, this may soon change. "There isn't anything secret about the programming techniques. I just sit down and create a full screen with as much detail as possible. The best so far is *Nature Explorer*, which is due out in October. The screen only took about a week to do, and I designed it while I was on holiday in Spain. Instead of using the three screens, which flickers when you try to scroll it, I just define 231 characters, and build the screen up using these. It's three much easier to get smooth scrolling."

Scrolling

The basis of Tony's programs is a screen-scrolling routine with a character set, and after getting the boring bits out of the way he sits down to plan the game.

"With *Potty Pigeon* I didn't have any idea what I was going to do, then I saw

Tony Crowther — "I enjoy the game more than *Acadogonic's Fortified Forest*. There are three levels to the background, which move at different speeds, so I used that idea, and the theme I worked out with my girlfriend."

Monty Mole

"*Monty Mole* is similar to *Loose* of *Blogger* — the same type of scroll but a bit faster. Unfortunately there were problems with the first batch, because the tape distributors couldn't get the Periods to work, so they changed the program. They corrected the characters set so that there weren't any 'A's' in the program, then they duplicated 3000 copies before anyone noticed. Sometimes it crashes, and it never returns — it was a real mess, but from now on I'm making sure to check the duplicating process!"

Perhaps Tony's best-known program, *Monty Mole* received nationwide TV coverage due to its tongue-in-cheek references to the miners' strike. "The character was the idea of Gremlin's Ian Stewart, and the original version was by Peter Harrop for the Spectrum. We looked at that and decided we wanted to do things that you couldn't do on the Spectrum, like the maze being generated randomly every time, so my version for the MS has some similarities but a lot of differences; you only get one life, the highest score you can get is 16, and so on. It

the money?" Just — Tony's latest, *Sekule Express* was a bit of a joke, it getting on TV — Peter Harrap's dad is a minor, so we gave a day to the local paper, and the next thing we were being phoned up by the national papers and the TV people. I was in Spain so I missed it all — but it would have been one if they'd known that my granddad was the President of the Civil Service?"

So Tony's "visibility" games, with a large playing area with scrolling backgrounds and fast action combined with original characters, have been a big success. And does he intend to carry on doing that sort of game? "No — I've done enough of those — I'd like to do a really good shoot-'em-up! *Sekule Express*, the latest *Greenlin* game, is the same sort of idea as *Loco*, but it's four times larger and the graphics are better than anything I've done before."

Tony's opinion of UK software isn't very high — "Everything seems to be a copy. *Loco* is actually based on an arcade game called *Super Locomotive*, but I only saw that once and I wrote the game a year later, so it's not a direct copy. I look at American software sometimes, and get some ideas there. The reason for my game's success was transcribed from sheet music, sometimes written by a friend — I got him to do the Jean-Michel Jarre music for *Loco*, but as it turned out it wasn't what I thought it was. I

asked for *Beatmaster Part 2*, but what I really wanted was *Exhale* by the Yellow Magic Orchestra, which is what *Coma* lives on *Disruptible*. *Sekule Express* is another one I've transcribed from sheet music: it's a Sky piece from *Sky 2*."

Director

Tony's games should now be heading to a new dimension. Having reused the ideas from his *Alphata* games, and come up with even better versions for *Greenlin*, he's now keen to get into new areas. For a start he has to think about his role as a director of *Graphics*: "I'm the only one that draws a wage, because all the others have other companies backing them. I get a sum for each cassette sold, and a percentage of the company's profits. When *Sekule Express* starts selling well there should be a fair bit coming in!"

Tony's next project is connected with the Red Arrows RAF display team. "They've asked us to write a program — they asked Commodore too, and they wrote back with some ideas, but I just laughed at it! Trumble is, they just want the sticks — I've got to figure out a way to make it into a game. It's got to be really well thought out, because it could just end up looking like a commercial for the Red Arrows."

Tony's "SC" Level Am and "A" Level Technical Drawing qualifications no doubt help in the design of the games, which look in some cases more like cartoons than computer games. "There's only Autodesk's *Paint*, on the BBC, that gives you a real feeling of cartoon quality — that's due to the way they draw black outlines around the characters. With my details, it's usually too small to do that. I'm doing some work on the BBC now, but really I don't rate any machines except the Commodore 64: it's so easy to write on, I can just sit back and do it. I'll give you that it's slow, and the Basic's poor, but who uses Basic? Aside from that there's nothing against it. I could write any Spectrum game I've seen, on the Commodore."

Tedious

So while he's over MEX, and is working on the BBC, Tony's main effort should continue to be on the 64 — which is good news for all Commodore game players.

After the *Red Arrows* project, Tony's plans might include a game based on the Ray Harryhausen film *Clash of the Titans*, in which mythological figures battle to the death. The complication of writing an adventure does't have much appeal any more — "It does get slightly tedious, having people remind you up asking 'How do I get past this?' — I'm getting the same thing with *Woody Mole*. Another thing I've done is to design the cover artwork for *Sekule Express*, and we've had an artist paint it. I've seen the Plus-4, and though it's got no sprites like the keyboard, you could write a sprite routine for it, but I think I'd like to write more for the 64. A lot of people will buy it, and 16K is enough to write a good game on — a lot of Atari cartridges like *Donkey Kong* and *Pole Position* are in 16K, and the early Ultimate games for the Spectrum. There's plenty you can do with 16K — like a good shoot-'em-up!" Tony comments, intending to a favourite theme.

Notepad

Tony's also working on a book on programming hints for the 64. "It's got some Basic in it, but it's largely going to be on machine code — things like screen scrolling, animated characters, machine code routines, playing sounds using interrupts, that sort of thing — it might put me out of business! We're looking at several publishers." But why write a book now? "Yeah! I'm enjoying it, getting reviewed in the magazines and getting my name in print. It's not the money that I'm after — I haven't got a Mercedes, I can't even drive! But I've got a good contact with *Greenlin*, and a scrap-book full of reviews of my games. Everyone in Sheffield knows me, though I don't get invited to open supermarkets yet. *Greenlin*'s going into the American market through UK Gold, Jeff Brown's follow-up to US Gold, and we're all working together to come up with new ideas."

"I took a little escapade with me on holiday in Spain, and it's full of ideas."

It should be interesting to see what springs forth from Tony's little escapade next! ■

ANIROG

NICK-NICK!

P.C. FUZZ

Aggro at closing time at the local. Getaway car screeches to a halt outside a bank. Ingenious methods employed by the Marla to literally spirit away the loot from the High Street. Never fear - P.C. Fuzz is on patrol.

HEARING BRIGHT page 84, changes are that at some time or other you will find yourself putting with most of your hard earned cash for a joystick. When fast reflexes are needed to play some arcade games, it's much much easier to press a button or push the stick in the required direction than watch a keyboard for that fabled "W" for up, "A" for left etc. Possession of one of these little gadgets will also enable you to use it in your own programs, and if used to its full extent, you can eliminate touching the keyboard at all.

Having said this, we need to know how to incorporate a joystick routine into our programs. A quick look at the Commodore User Manual reveals absolutely nothing! What we need is to have a routine in our main program to check values held in BYTE 56120 when the joystick is in port 2 (56121 for port 1). The first five BITS of BYTE 56120 are used to detect joystick movement.

Activity

If you type in the Extended Joystick Demo Program, leaving out the REMs if you wish, then this will show exactly what is going on inside the computer when you move the joystick. A chart is displayed at the top of the screen, which simulates the activity at this address.

The second row on the chart shows that with the joystick in central position BITS 0-4 are turned on. The top row gives the decimal value for each BIT. The third row displays the BINARY value by changing to a ONE when the BIT is turned on and ZERO when it is off. The BIT number is shown on the bottom row. Just underneath the chart given as the format to be used in our IF-THEN statements, with the decimal total for each direction as well as the fire button.

This format may be used in all of our IF-THEN statements, which we will need to use to determine which joystick direction has been used, and what we are going to do about it. The demo program, however, PEEKs address 56120 only once, in line 500. The computer then stores this value in the variable X and takes the appropriate action from one of the next IF-THEN statements lines.

Address

Now try moving the joystick and pressing the fire button. You will see the BITS turning on and off and the binary and decimal values changing. By adding together the decimal values of all the BITS which are turned ON, we will arrive at the BYTE value held at this address. With most modern joysticks there are a total of eighteen different combinations that we can use. The animation of the juggler at the bottom of the screen proves this by juggling a total of eighteen different objects for the different combinations of movement and firing. This is only a simple demonstration, but shows that we can make an animated character perform eighteen different tasks. For instance, our character could be, say, a cowboy who walks left when we move the stick left, fire a gun while walking left when we press fire at the same time. If we

PROGRAMMING

An ode to joy-sticks

Frank Bagley's novel demo program shows you how to exploit your 64's joystick routines

move the stick diagonally up and left and fire, then he could throw a lance etc. etc.

Needless to say, not all of the IF-THEN statements need be used. If we only wanted to move left, right, up, down and fire then only the first five lines from 560-570 of the demo program would be used. Inclusion of all of the eighteen IF-THEN statements in an arcade game in Basic would probably be insupportably slow in some instances.

Ability

After you have studied the effects that the joystick movement has on the chart on the screen, we can experiment a little by modifying the program slightly to be able to move the juggler about the screen. First delete lines 600-690 in the demo program. Now alter lines 510-590 as shown in Figure one, not forgetting to add line 601. Now save the new version of our program before running. (any experienced programmer knows about the perils of running an untested program!). Now when we move the joystick - "Hey Presto" our juggler moves about the screen in any one of eighteen different directions. Exercise of

Available for five and eight

the fact that the computer is still going through a lengthy routine as 56120 is updated the chart display, movement is not very fast. This is why X and Y are incremented or decremented by two pixels rather than the more usual and smoother one. For extra speed, try altering the rows to a higher figure. Note that when the fire button is pressed with the joystick in the upright position, the screen will change to a random colour.

Adventure

This is not the shortest routine to move a sprite across the screen, but it does have the advantage that we have at least another eight or nine options open to us. For instance, try moving the joystick in any direction and press the fire button at the same time. Nothing happens. Our juggler doesn't even move. On looking at the chart at the top of the screen we can see that several BITS are turned off, and the total decimal value adds up to a figure not covered for in our IF-THEN statements. We deleted items in lines 600-690.

Now, as a final experiment, type in the missing lines 600-690 but add your own commands, like making the border change colour or perhaps make a different sound for each direction if the fire button is pressed almost unnoticed. The more adventurous may even make the juggler a different colour or make him disappear!

This then will give you some ideas of how to use a joystick in your own programs. It's not the only way, but probably the simplest and most accurate way to do it. Remember, inclusion of a joystick routine in a program can make it much more acceptable and certainly a lot more fun. ▶

Cry Havoc

Dynamism's *Havoc* is a very sophisticated *Raven* sequel, using a perspective graphics technique quite unlike anything seen before. Controlling your fighter through a landscape of towering buildings, strange ground markings and hostile enemies, avoiding bombs and missiles and negotiating increasingly impossible passages, you are the last chance of your besieged homeland. If it was left up to me they wouldn't have a hope. *Havoc* is technically/breathlessly difficult — possibly the ultimate challenge for arcade fans, and a brilliant piece of programming.

The fast, the slow
and the slug-like reviewed
by our whacky team

Fortified

Stockade proves that there's life in the *Star Wars* theme yet. It's very simple and charming, with decent sound effects and well-animated characters. Playing a not-very-online searching for treasure in a Cavalry fort, you have to avoid traps — big ponds, ledges — instead on giving you a drastic haircut. Bullets and arrows fly everywhere.

Animation and sound effects are nice — a good game, and the first national release by a small company. *Wordlight*.

Thrilling

How do they do it? Mastercraft's latest effort, *Thriller*, is only £3.99, and makes a lot of the high-priced opposition look cheap. Based loosely on the Michael Jackson *Thriller* video, *Thriller*, programmed by the Darling duo, has five excellently-drawn screens — graveyard, mansion and so on — through which you have to travel collecting crosses and avoiding various ghosts. Good music and sound effects, nice animation, and it's a bargain. Whatever will they come up with next?

On the beam

A *divine*, having seen the light and begins to convert video-console

Solid gold program

How can this Olympic program be described? What about THE BEST PROGRAM EVER WRITTEN FOR THE 64? That made you sit up and take notice, didn't it?

This disk/double tape epic from, appropriately, *Eyes US*, is graphically astonishing, from the animated opening ceremonies

to the closing displays. The backgrounds are incredibly detailed and the movement of the characters is almost silky.

The events — Pole Vault, Diving, Shot, 100 Metres, Cynostonia, Swimming Relay, 100 Metres Swimming and Clay Pigeon Shooting — present a fantastic opportunity for programming virtuosity, which is meted brilliantly.

Up to 8 players can take part, and national uniforms are perfectly realised.

It will be a long time before a program comes along which can seriously challenge *Summer Games*. Get this one NOW!

games into software, look out to become a major force in the industry. **Blasphemor** is remarkable graphically, and the scenario is not boring now, but it's fast and furious and had me hooked pretty quickly. Looked at impressively it's just a variant of Galaxian, in which alien rooms towards you on light-paths, and the occasional Motherbird has to be dealt with using special weapons. Fortunately I haven't had the urge to look at **Blasphemor** impressively, which must be a good sign.

Son of Patrol

Falcon Patrol is a revised Defender-derived shoot-'em-up, and **FP2** is a close sequel programmed again by Steve Lee.

Fly your Falcon VTOL jet over the beautifully-detailed desert landscape of pyramids, bomb sites, wrecked hotels and burned out shoppers — launch missiles forward or down at ascending helicopters before they eat you, or land behind anti-aircraft emplacements. Watch your radar display and launch out radar jammers, landing on your pad to refuel in time to tackle the next wave of battles.

Great music made by Dave Lee, and the best explosions you've ever seen. Don't forget **FP1** is on offer at £2.99 at the moment, as are many other 64 and Vic

games from Virgin.

Another one for the shopping basket, sign ...

Knockout

Commander at least recognises the demand for new Vic 3D games, and **Raptor Punch** will keep Vic users happy for the moment. It's not that its particularly good, but bugs can't be choosers.

This joystick-only game places you in a deserted dungeon, around which you move spreading light (if not sweetened). Search for the hidden treasure chest, avoid spinning axes, battle firing dragons and dragon's eggs. You can run your enemies through with your rapier when a tone sounds, otherwise combat is fatal. You can also throw knives, but these have the habit of reorganising eggs to hatch out.

With 99 levels and a time limit to play against, **Raptor Punch** isn't very exciting to look at, but could offer many hours of play to the dedicated.

Living on the ceiling

Easily the best thing to emerge from **Entertainment**, **Lazy Jones** is 17 games in one. You play the opportunistic Jones, who moves around the three floors of a hotel using elevators, avoiding the manager, the phone of the previous manager, and a hostile cleaning lady, by leaping over

them. There are 18 rooms to hide in, and — here's the tappy part — 15 of them contain game machines which you can play to add to your score. Ranging from **Eggie Check** to **Wild Wales**, with marvellous optic animations and astounding musical scores (99 **Red Balloons**, **Fade To Grey**, etc), the mini-games are all perfectly playable in themselves, and make **Lazy Jones** one of the most original and value-for-money programs for the 64 yet to emerge. Just one question — why does it play **Living on the Ceiling** every time you hide in the goods?

Exam time

While doubtful about the value of some educational software — after all, it's the syllabus that you should be concentrating on — I must admit that the Longman's Exams Revision series looks good. So far subjects covered include Chemistry, Physics, Maths and Computer Studies, at CSE and O Level.

The Computer Studies program contains five sections, the first four covering major problem areas and the last being a database which is intended to aid revision. Each program is menu-driven and illustrates the topics with interesting graphics.

Dr Watson solves the 64 machine code

Chris Whitcombe educates himself in Machine Code with two teaching packages, and tries out a basic compiler

ANYONE trying to teach me Machine Code would have an insurmountable task. My friends who understand this strange language say "you've got to forget all about Basic and think in M/C and Hexadecimal". I'm afraid that I find it difficult to follow this advice; good as it may be. I don't even think in metric yet! I will believe in feet and inches . . . and half ounces!

Unfortunately, Basic is not good enough if you want your Space Invaders to move about the screen at something more than a snail's pace, so I suppose that I am just going to have to knuckle down to some serious study.

Despite my pessimism, things are not quite as bleak as they may at first seem. There is plenty of help about in the form of books and learning packages.

One such offering comes from Honey-bolt's Dr. Watson computer learning series and is entitled *Engineer's Assembly Language Programming for the IBM64*. The package contains a book and a cassette. On the tape is a full 6400 Assembler, a Machine Language Monitor and a Binary/Hexadecimal/BCD addressing program. The introduction to the book implies that no pre-existing knowledge of Assembler is required. I hope this is the case!

Labels only

Chapter 1 starts at a fairly leisurely pace using short programs to explain a few of the instructions that you will need to get started. You are then shown how to list what you have typed in, using the Assembler, and this displays a table showing the Assembly program and what it looks like in Machine Code. More commands are then added to the program and explained in some detail, along with a diagram showing the relationship between the Accumulator, ALU, X and Y registers. Like most of the chapters in the book, this one is liberally sprinkled with exercises throughout. "Just like being back at school?" I hear you say. But with these, nobody will know if you cheat . . . except you. Actually, they are quite a good idea, as they do help you to discover whether or not you really have understood what you thought you had understood. Having learnt how to manipulate information into and out of the Accumulator and Registers, chapter 2 shows how to jump around a

program . . . a sort of machine code GOSUB.

This necessitates explaining about the Program Counter, Unconditional jumps and a few more commands to help you on your way. The chapter ends with a short section on flags. I think I'm going to have to read this bit again . . . and do the exercises of course. The next chapter starts by explaining more instructions on entering information to the screen. The examples (eventually) run so fast that you need binoculars! This naturally leads on to a section about timing loops. In Basic, nothing ever happens fast enough. In Machine Code, it seems, the reverse is true. There are different "modes" of addressing in M/C and these are all explained at some length at the end of this chapter.

Logical

Chapter 4 starts with Logical operators and continues on into the use of Hexadecimal numbers, Binary-Coded Decimal, Bit Manipulation and Binary Division and Multiplication . . . Gulp! Half way through the book, and things are starting to get hairy. We are now up to Advanced functions of the Assembler including the use of Labels, Memory Labels and Macro instructions. As in all the sections, these commands are explained at great length and you should be able to get the hang of it, if you don't take it too fast! This chapter ends with an explanation on how to convert your Machine Code programs into Data statements. No worries here . . . the Assembler does all the hard work for you. If you don't want to "mess about" with Assembly Language but find instead that you would prefer to work directly in M/C, then chapter 5 is for you. This details the functions of the Machine Language Monitor (an option of the Assembler) showing how to enter or amend programs by typing Hex values straight into memory locations (EEKS). The chapter continues with sections on processing M/C in memory, how to Save and Load using the Monitor and Register Display and Debugging.

If you have got this far in the book and understood it all, then the next couple of chapters should hold no fears for you whatsoever. We are told that, after having learnt how to do things the hard way, some functions can be more easily and quickly in

this possible by performed by using the 64's built-in subroutines. Many of the more mundane operations, like printing a character on the screen, can be readily done by using this method.

Chapter 8 explains how to use Interrupts and how to interrupt them! For the mathematically amongst you, the end of the chapter is devoted to signed numbers, Overflows, Floating point numbers and various subroutines that could be useful when using the aforementioned in Machine Code programs.

Labels!

Chapter 9 has the solutions to all the exercises set throughout the book. Even Appendix 1 has sections in it! However, it does also explain in great detail about Binary, BCD and Hex notation. The last 2 sections of the book are appendices of everything you need to know to put your newfound M/C skills to best advantage. All the 64S instruction set is listed along with the number of bytes each Mnemonic uses and how many clock cycles it takes to operate. The state of the various flags is also shown for each operation and Truth tables are included where appropriate. A memory map lists all the Labels along with their locations and a brief description of what they do. There are also similar lists for the Basic ROM and Kernel ROM. The last section details the Kernel routines and their uses.

The package is well presented and the book is fairly easy to follow considering the subject matter. I particularly like the way in which the first couple of chapters are not too overpowering and lead you gently into the rest of the book. So many authors try to impress you with how clever they are, and end up by only confusing you, instead of helping you to understand what they perhaps consider elementary. What you really want to know is, of course, have I now mastered Machine Code? Well no, I haven't . . . but I do feel that, with another couple of reads through the book and a little less cheating at the exercises I should be well on the way to learning Assembler. In conclusion, a professional package, well written and highly recommended. ▶

Dr Watson — well presented

Complete Machine Code Tutor — a textbook on cassette

4 . . . and at £12.50 good value for money too.

Another package along similar lines to the Dr. Watson is the **Complete Machine Code Tutor** from New Generation Software. This uses a different approach however and, instead of having a textbook and Assembly tape, this offering uses 2 cassettes and what might be, generously, termed a booklet. While loading the first tape side, a browser through the "comprehensive reference manual" shows it to be really on a directory of what is on the tapes along with a few explanatory notes, none of which appear within the cassette text anyway, thus making the pamphlet more or less redundant.

Lessons

The 4 sides of tape are filled with lessons and exercises; the lessons bring pages of text about all the various instructions and addressing modes used in Assembly Language. The exercises, unlike the Dr. Watson idea, are not in the form of a test, but are more an example program listing. By pressing the Return key, the cursor is stepped through the program line by line, and the changes made to the contents of the registers, flags, etc. are displayed in table form along with a 1 line explanation of what is happening. Although you can edit the program and see the different values in the registers, you cannot actually run it to see what it does. This is because the package does not contain an Assembly program . . . it is only an Assembly simulator. This means that what you have here is really a textbook on cassette. As most of us are unable to carry our 40's and TV's around with us, it does not seem to have any advantage over the real thing! As such, I'm not sure who it is supposed to appeal to. The information contained in the package is sparse, to say the least, and it does not include an Assembly . . . at £12.50 it's not cheap; give me a good book instead.

If you feel unable, or unwilling, to get down to some serious study in your quest to master Machine Code, then there is a

possible alternative.

You might like to try a Basic Compiler. The **Jetpack DTL Basic** is just such an animal and it promises to improve your Basic programs by making them run faster. DTL Basic 64 is available on tape at £14.95 or disk at £29.95, the latter version having the usual advantages of speed, larger program handling and other additional features.

Long

This is quite a long program, so while the tape is loading you will have plenty of time to study the leaflet that accompanies the cassette, it does say at the back that the company can supply separately the full Compiler manual which describes the functions of both the tape and disk compilers in more detail . . . it doesn't say whether or not you have to pay for it! It also states that a user of the tape version may upgrade to the disk compiler . . . but, again, no mention of money. After the program is loaded, you are prompted from the screen to enter the name of the Basic program that you want compiled, and the computer will then look for that program

on the tape, and when it finds it, it will load it in and do the business. The Compiler will make 2 passes through the source file which constantly displays the number of the line being worked upon. When the second pass is complete the user is prompted to insert the tape that is to hold the new version of the program and, if you so command, a copy of the "Run Time Library File" (which is a list of Assembly routines used by Compiled programs) which is needed to enable your 64 to Run the new high-speed program that you have just created. But, looking on the bright side, the DTL file only needs to be entered into the computer's memory once, and then you can Run so many Compiled Programs as you like . . . as long as you don't switch off.

The Jetpack Compiler performs exhaustive checks while going about its business and will report all errors found giving the relevant line number followed by an error code; a list of which appear at the back of the leaflet.

Leaflet

It is not unusual for CDM Basic to be extended using extra statements implemented by Assembly routines to BASIC or KAM. Fortunately, the DTL Basic 64 has a special feature which takes these in its stride. Also, compiled programs can use existing Machine Code subroutines without any alteration.

The leaflet claims that compiled programs CAN Run up to 25 times faster but that something between 5 and 15 times is more typical. A fast garbage collection routine is included that avoids very long delays that can occur in programs with a lot of strings. Compiled programs, it says, normally occupy between 58% and 66% of the space of the original program. I ran a couple of my past efforts through "Jetpack" and they were certainly faster, although it is not easy to judge by how much. Whether or not a compiler is the answer to your programming problems, only you can decide; but Jetpack could be well worth a look. I only wish that the complete manual came with the tape instead of it being an "optional extra". As far as I'm sticking with Dr. Watson ■

Jetpack DTL Basic — well worth a look

THE BEST SOFTWARE IN AGES

C-64 SPECTRUM BBC ELECTRON

FANTASIA DIAMOND

Dive deep into the age of fantasy with a host of intriguing characters that may help or hinder your exploration of this dream world.

Retrieve the magnificent Fantasia Diamond recently stolen and repair from the master spy from the imposing fortress and its evil guardian. Talk to the Wizard, Wizard and other characters to elicit their help. An enthralling and sophisticated graphic adventure by Kim Fogarty for the Spectrum 486, Commodore 64, BBC Model B* and Acorn Electron*.

SEP 87-95

HEATHROW ATC

Your challenge in the age of technology is to direct the incoming air traffic at the world's busiest international airport, Heathrow. Monitor the stack display of aircraft, heading, velocity and aircraft type. Scan the radar for slips and stalls. Develop your skills to tackle emergencies, rogue aircraft, radio and instrument failure. A highly acclaimed simulation of one of today's most demanding jobs. By Mike Mace for any Spectrums, Commodore 64, BBC Model B and Acorn Electron.

SEP 87-95

HEWSON CONSULTANTS

Specialising in the design, development and testing of computer software.

3D LUNATICK

Do battle with the Spectrab in a futuristic age of space and around the mountains of the lava landscape. Equipped with the latest nuclear blasters, laser missiles, radar, navigation and shields, penetrate the Spectrab defenses and head towards their command base. Destroy the Spectrab-Gun Tanks, Armad Movers, missile sites and Howitzers. You may not fall in your mission to drive the Spectrab from their lava base. A stunning 3D Graphics Presentation by Steve Turner for the Spectrum 486 and Commodore 64.

SEP 87-95

As part of our continuing commitment to innovation software for an ever-changing market, Hewson Consultants will now offer a range of products on CD-ROM.

Are you only using

To play only games on a Commodore computer is like asking Albert Einstein to work out the square root of four.

The computer's brain barely ticks over.

To really stretch it, you need more interesting software programs. For example, record keeping, interactive education, stimulating adventure games or word processing.

And for these you need peripherals.

Like a Commodore disk drive, a really fast storage and retrieval system with a vast memory. Or a Commodore cassette unit, the inexpensive way of loading and storing programs.

For those who like the idea of text and graphics being more alive and having greater clarity than on a TV, there's the Commodore colour monitor.

QUALITY CONTROL FROM CREATIVE SPARKS ON C64

For those who demand excellence

Creative Sparks Ltd. 1987

18 KX 188

Quality control around the screen is a good thing. In this action game, you'll be the one to control the screen. The screen is divided into levels of floating lava being constantly shovelled down on the floor. The skill and precision in this highly original fun game.

4 full graphic action screens,
100 levels of play,
high score feature,
fast loading cassette.

COUNTDOWN TO MELTDOWN

An amazing graphic action adventure game which puts you in charge of a team of androids trying to reach the core of a nuclear reactor before it explodes.

This game has over 2000 rooms to be explored and every single one of them is in 3D!

Probably the most exciting game yet developed for the C-64. Fast loading cassette.

BIRD MOTHER

This is a delightfully original game which sees nature as the setting for a highly compelling and challenging game. Guide the Bird Mother as she builds her nest and raises her young, finally protecting them from a predator hawk.

Fast loading cassette.
The stunning graphics and music in Bird Mother are not to be missed.

WING COMMANDER

This is a highly sophisticated flight combat simulator which puts you in the pilot's seat. Highly advanced machine code programming has ensured you feel every stomach lurching dive

and roll, maneuvered and several ground targets to be defended from the attacking enemy bombers. This game will stretch your skills to their limits.

Fast loading cassette.

Tony Crowther presents LOKO for the 64

THIS MONTH'S Star Game for the 64 comes from the Peaty Pigeon man, Tony Crowther. 35-year-old Tony wrote *Loco*, *Nike West*, *Blipper* and many more hit games for Alligata Software before moving to Granada Graphics.

Granada, based in Sheffield, is a new company dedicated to putting out only the highest quality arcade extravaganzas. Tony Crowther's programming skills are demonstrated to the full on *Peaty the Peaty Pigeon*, *Misty Mike* and *Outside Escape* — for more details read the Profile feature in this issue.

Loce has written *Loce* specially for Commodore *Atariwars*. You control the locomotive chugging back and forth in a siding, trying to fend off attacks from enemy fighters, bombers and airships.

Using a joystick in port 1, press the fire button to release deadly smoke bombs. Each time you hit an enemy, it moves back to the top of the screen; but you can't destroy them, so your doom is inevitable. Hit the bombs to score points, and remember that pressing fire will always fire a new bomb, and only one bomb can be on the screen at a time. ■

COMMONWE 64; SPECTRUM 48K

November 1989 Commodore Horizon 45

Stop the Express

If you have not already guessed from its name, the 1241 Express is a little "back box" which allows you much quicker access to your 1241 disk drive.

With this product your 64 can access and load files from the 1241 at about twice the normal speed. This frees you from the two or three minutes taken to load large programs or files. The 1241 Express is marketed by Ram Electronics, and retails for \$49.95.

For your money you are supplied with a cartridge which plugs into the 64's cartridge port, and a short manual (8 pages) to aid installation and explain use of the cartridge.

Before you can use the 1241 Express it is necessary to connect two wires from the cartridge, to two chips inside the 64. This means that the lid must be taken off the 64, which could void your warranty, so be warned!

No hesitation

Having removed the lid on my 64 many times, there was no hesitation at the prospect of more prodding around inside. The two wires are labelled 6510 and U14, indicating the chips that the wires must be connected to. They both have a small grip on the end of the wire so that the connection is secure, but easily removable. The wire marked 6510 is connected to pin 18 of the processor, and the wire marked U14 is connected to pin 15 of the chip marked U14 (in fact the chip itself is not marked U14, it's labelled on the board beside the chip). It is advisable to run the

wires through the back of the 64 so that it can be closed properly!

There's no problem if the wires are connected to the wrong pins; the cartridge simply won't work and you will have to check the connections.

When you power up the 64 with the 1241 Express properly installed, you'll see three lines to the power up message instead of two. The second line should give the product name and copyright message. The amount of RAM is not affected; there are still 384K bytes available.

The manual is the usual badly lacking, as it is so often the case. However, this is a pre-production version. The manual is eight pages long, and the presentation is not nearly as professional as the product itself. The eight pages cover the installation of the cartridge, the operating instructions, limitations of the cartridge, working with other peripherals and very few programmers' notes.

There could have been a great deal more explanation of the cartridge in general, and the problems that might occur in using it with other peripherals. A few demo programs with documentation would not have gone amiss, and certainly more information for programmers wishing to make extensive use of the cartridge and its facilities is a must.

Unlike the manual, using the cartridge is very simple and smooth. When the 64 is powered up with the 1241 Express installed, the two function keys F1 and F2 are set to toggle between fast and slow mode. In other words the normal disk access time may be used with the cartridge in place by

pressing the 'CTRL' key and the 'F2' together; the screen will flash once quickly.

To get back to fast mode simply press 'CTRL' and 'F1' together; again the screen will flash once, although this operation takes a little longer. Holding down the 'SHIFT' key and pressing 'BLN-STOP' will load and run the first program on disk. The cartridge changes the default device to disk, saving the need for the 'D'. Files can simply be loaded in the form: `LOAD"<filename>(<version>`

There is no need to enter the device number or close the quotes, and the usual abbreviations are accepted.

Benchmark results

Ram Electronics claims up to three or four times the usual access time. This is more like twice the speed on average. Here are some of the results from the benchmarks, giving normal times first then times with the cartridge.

Loading 12K program : 0 min. 24 sec. ; 19 sec.

Loading 12K program : 1 min. 31 sec. ; 1 min. 8 sec.

Loading 54K file : 1 min. 32 sec. ; 1 min. 8 sec (Paperclip file)

Loading 54K file : 1 min. 32 sec. ; 1 min. 8 sec (Paperclip file)

These tests are all approximate, but even so they do not actually amount to three times the normal speed. They do however make a huge improvement, particularly with normal programs, but even with files loaded and saved from a word processor. The 1241 Express will work with Easy

Script, Pacwrite, and, I am informed, most other soft loaded word processors. From the tests, disk access time is in general reduced by half.

Using other software such as utilities and Basic simulations does not have any adverse effects, even if a program does conflict, it is often possible to load and run it by switching to normal mode.

The 1541 normally objects to sprites being on the screen while the disk is accessed, but not so with the cartridge installed. You can display sprites and still have access to the disk.

The cartridge reserves one of the drive buffers, reducing the number of files OPENed at any one time from 3 sequential, or 1 sequential and 1 relative file, to 2 sequential files or 1 relative file, in fact mode.

An RS-232 modem may be used with the cartridge. This allows swift downloading of programs. However, if you wish to have more than one device connected to the del's serial port while using the 1541 Express, you will have problems, as it will only accept one. So anyone with a 1541 and a printer connected to the serial bus or two 1541's will not be able to use the cartridge with more than one of these devices.

Ram says it is just about to market a cheap cable which will allow you to have two drives, or a printer and one drive, connected whilst using the cartridge in fast mode. The cable will also have some other features — as yet no details, we shall have to wait and see.

The cartridge will give you the extra

facilities described before the "SOFT REWIND - STOP" and default to disk, whether in fast or normal mode. Depending on what printer you are using and how it is connected, the cartridge may work in slow mode with your printer. Two single drives may be connected with the cartridge installed, but only accessed in slow mode.

The code for the cartridge is inevitably the normal cartridge space is 16000 to 19999 hex, but upon examination there was nothing there. The space that normally occupies the ASCII code for the power up message has some strange code and the area from 16000 hex onwards will not disassemble. So for those who are curious, this should provide some challenge!

In conclusion, it's a shame about the manual; it could have contained a lot more information and the presentation could

have been better. The other drawback is of course the lack of a cartridge port when using the 1541 Express; any cartridges you normally use, or wish to use, cannot be connected. It seems the only way around this is to buy an expansion board. Even then I am not sure if they would work together — perhaps Ram Electronics will clarify this in the near future.

The product is overall all it claims to be and saves a lot of time if you use your 64 and 1541 daily. The general standard of the product is very high and I have no hesitation in recommending it; in fact since reviewing the 1541 Express I have purchased one myself. It is one of those products that you just have to have in spite of the price! ■

Kevin Bergin

For work or play Voltmace has the answer!

For play The delta 3sc joystick is intended for the more sophisticated user. A lightweight unit designed to be hand held and operated by the fingertips of the other hand. The joystick slide switches cannot be depressed by excess pressure on the joystick and the buttons (choice of three) have been tested for millions of operations.

For work The datapad 16c — a sixteen way full travel joystick for the Commodore 64. Simply plugs into the two control ports. Complete with a cassette program to refine the key characters. In operation just push on the "start key" to select keyboard.

CHALLENGING SOFTWARE

Less than human, for more than mere computer

The Psytron controls the massive Battle 2 installation. When the attack comes, it will cope with defences designed which would leave a human brain unshaken, computer brains assembled. Damage to any sector of the base must be contained and its effect on the logic of the installation calculated immediately. Human lives will be expended as necessary but the Psytron never gives down.

The Spectrostrange enters into a contest with the Commodore 64 and better than ever!

at all good computer game shops

Drive faster!

1541 EXPRESS

There's nothing worse than waiting for your program to load. And good

though the Commodore 541 is, speed isn't exactly its biggest feature.

Hook up the new 541 Express from RAM, though, and you'll be up and running like lightning.

This ingenious add-on speeds up data transfer from the 541 and new 542 disk drives to your Commodore 64. So much so, that you'll wonder how you ever found the patience to wait before.

With the Express you can load programs in a third of the normal time. That means less frustration and less time wasted.

(You can fit it yourself in minutes, too—and disconnect it just as easily.)

The new 541 Express from RAM.

To shift your drive into top gear, call into your nearest dealer today.

Or call our credit card hot line on 02514 25252. (Access and Visa welcome).

Speak and spell with Currah's little chatterbox

David Fox strikes up a conversation with the Currah Speech 64 voice synthesiser

AS A PRELUDE to a full review of speech synthesis and voice recognition hardware, which will appear in the New Year, this is a brief look at one of the most attractive speech synthesisers on the market — the Speech 64 from Currah.

Currah's Microspeech for the Sinclair Spectrum was highly praised, sold in thousands, and led to many software houses incorporating it into games. The Speech 64 is an improved version of this unit, and works on the same basic principles.

Human speech can be treated into around sixty sounds, known as allophones. Rather than limit the range of a speech synthesiser by programming it to reproduce a small number of words recorded digitally into PROMs — Programmable Read Only Memory chips — Currah chose to combine allophones and leave it to the individual to combine these into whatever vocabulary was required. To be more clear, you can program Speech 64 to say anything you want it to, though it will sound fairly mechanical — but this adds to the fun, I feel.

Advance

The Speech 64 plugs into the cartridge port and its DIN plug goes into the audio/video socket. Entering INIT will activate the system, which will print an additional copyright message on the screen.

The Speech 64 plugs into the cartridge port and its DIN plug goes into the audio/video socket. Entering INIT will activate the system, which will print an additional copyright message on the screen.

Any key pressed will then by "reset" (remember to turn up your TV volume!)

One great advance incorporated into Speech 64 is that it can speak in a variety of voices — low or high, with or without inflection.

This has great potential for use in games, especially adventures where different characters could be given widely differing voices. Key raising can be disabled with &DHF, though for chunky programmes it could be a boon. All voice selection commands can be incorporated into basic files.

Allophones

There are two methods of inputting speech — in ordinary English (or for that

matter any other language you require) generated by a SAV command, or in allophone form, combining the 98 available allophones for more precise results.

The Speech 64's text-to-speech converter is incredibly impressive, and nothing like it has been available for the Commodore before now. The unit's operating system even includes a "look-up table" which takes care of words with non-standard pronunciations like "through". Still, it is possible to make it pronounce many words oddly, so this is where the allophone form comes in handy — though it takes a little getting used to.

Errors

Let's try a little allophoneic composition. "Welcome to the United States" would be entered allophoneically as "welkum tuun uhleerz vryunaytshyzd steytzz". Obvious when you look at it!

Speech in the speech can be produced using standard pronunciation, and if you make an error — enter a non-existent allophone — you'll get an error message. Normal text and allophones can be mixed

in a SAV statement by enclosing the allophones in square brackets.

Upper case gives higher intonation, so in effect Speech 64 can produce four voices at different pitches. Clever programming can also reproduce different accents and character traits.

Speech 64 doesn't slow down the execution of programs, since it includes a "buffer" where speech information is stored and released at a standard rate. If you STOP a program the buffer is emptied — otherwise you might have 30 seconds of sustained speech.

Examples

The comprehensive handbook claims that it's much harder to program Speech 64 in machine code than it is in Basic. However, I doubt whether it will present any difficulty to experienced programmers. Full details are given of how to achieve any operation in a number of modes, and there's an example Basic program — a speaking clock using the 64s internal T15.

Attempts

All in all the four voices, text-to-speech conversion and low price — £29.95 — of the Speech 64 make it seem certain for success. Other attempts by various companies, including Commodore itself, to introduce speech synthesisers, have failed due to a lack of software support and marketing know-how. Currah, it seems, will be making no such mistakes. Already expectations are being carried out with a number of big software companies to produce Speech 64 compatible games — *Anting's PC-Face* should be the first one. If it's success, it may well be the first of a long line of talking games which will exploit the capabilities of Currah's excellent product to the full. ■

Currah's Speech 64 — four voices and text-to-text speech

COMMODORE SOFTWARE FILE

Paralander

Paul Taylor of Belmont, Larkian leads the game for the 64
PARA LANDER is a two stage game. In

the first section you must land 10 paratroopers safely on the moving rails below. Use the fire button to drop a paratrooper from your bomber. Random circumstances make life difficult.

In section two you must rendezvous your bomber with a fuel station, but you can lose

a life if you collide with a thunderbolt, reach the bottom of the screen without refueling, or exceed the 15 second time limit, which increments by 5 seconds in each attempt. Proceed to part 2. Type in all REMs or you may encounter UNDEF'D STATEMENT errors.

Attention all Commodore 64 owners with a 1541 disk drive

MPS TOOLKIT

- Single Drive 3-Pass Disk Backup — or individual tracks.
- File Copy — transfer any number of files at once, up to 255 files long.
- Disk Error Locator — also checks for proper head(s), DSI, ID's & catalog, with printer option.
- Disk Error Maker — tracks 20, 21, 22 & 23 errors, necessary for proper backup of protected disks.
- Disk Drive Monitor — address the drive's internal ROM & RAM.
- Disk Doctor — catters of users, read and change sectors, recover lost data.
- DOS Changer — Protect your own disks.
- Disk Log — displays all files on a disk, including start & end address, beginning track and sector, with printer option.
- Loading Address Navigator • Disk Test
- File Recovery • Comperator
- Plus many more useful features!

Besides of instructional MPS TOOLKIT is the only disk utility for sale in the UK which includes all this at such a low price. Comes complete with instructions to easy to use.

ONLY £12.95 including P&H
 Foreign orders, please add £1.00.

Graphics

Andrew Tilley from Tewkesbury sends this program for the ZX Spectrum

THIS PROGRAM uses the graphics facilities of the Super Expander to create a collection of designs.

On running the this page appears. Press any key to continue. The graphic designs will then start to be drawn. The

randomisation routine near the start of the program is used to overcome the fact that the computer will generate the same pseudo-random series of numbers each time a reset is called, resulting in identical patterns each time.

```

Send us your Commodore programs, enclosing a cassette — and a printout on plain white paper if possible. Each listing must be accompanied by a typewritten introduction describing the program and explaining how it is constructed. We pay £4.00 for each bug-free listing published. We cannot guarantee to return every program submitted, so please keep a copy. If you want us to return your listing you must include a stamped, addressed envelope. If you have any problems with the programs, please write to the appropriate author, Software File,

Commodore Horizons, 13-15 Little Newport Street, London EC2E 3JD

Lack of description

Book: *Compendium of Games*
Author: Kevin Margis
Publisher: Doubleday
Cost: \$3.95

Reviewed: C. Hoffmeister

This is a book of 20 programs — some games, some utilities. Each is presented as a listing with comments about how the program works in the same fashion that can be seen in many of the computer manuals, eg Line X — Line Y "Set up variables". While this format may be acceptable in some instances, I think that a book written along these lines should be more descriptive. In some cases, in this book, large sections of the program are completely ignored.

Amongst the offerings are a Snake game, Dangles, Car Dodge, Hangman and the obligatory "Dot Matrix". The utilities are no more exciting: Hi-Res graphics, Block graph, Code creator, User basic and Tape search.

As one of my passions is music, I was pleased to see a program which allows the keyboard to be used to play tunes. One is also able to change most of the sound parameters. But the result was disappointing. Also, the program will not work as it stands — to my knowledge, the Commodore cannot handle a program line of 88 characters.

1981 Kevin Margis explains that the program will work if characters are taken in all lines greater than 88 characters.

At \$3.95 that represents about 20¢ a program. For that sort of money you wouldn't expect too much. For anyone wanting good games, you would do better spending the money on the "real thing" and trying to learn something about programming would get better value and just as much knowledge from half a dozen computer magazines. Sorry.

Structured programs

Book: *Structure Your Compendium of Games*
Author: Philip Williams
Publisher: Century

Author: M. House

Cost: £2.95

Reviewed: Phil Banner

THREE VERY misleading statements appear on the cover of this book which detract from an otherwise excellent volume. The first of these is the title, as the text includes very little which would not apply equally well to almost any other home computer. The only specific references to Commodore machines come in the appendices, which include brief instructions on handling Commodore peripherals and on using the function keys in Basic programs.

The second and most glaring

fault occurs in the back-cover blurb, which claims that the book "... makes full use of the machine's sound and graphic capabilities." In fact the book makes no attempt whatsoever to do either! The Pokey command is not even mentioned. So, what does the book try to do?

In aim it is to teach the beginner structured Basic programming and good programming habits, and this it achieves very well. It is clear and concise, working through all the fundamental Basic commands logically, with use of flow charts, and building up to an elegant listing for a Matrix Imperial conversion

program. Finally, it contains listing manipulators in some detail and makes brief mention of arrays and other commands.

The style of the book is serious without being stodgy, and avoids the pitfall of treating the reader as if it were business to idiosyncrasy. Philip Williams has provided a thorough home-tutor for the person who wishes to learn to program properly. He has not set out to provide just another substitute for Commodore's User's Guide.

The book is attractively produced and represents excellent value for money at £2.95.

Vic20 giant book of games lives up to its title

Book: *Giant Book of Games*

For: Four Vic 20

Author: T. Hartnell, R. Cook and R. Hoag

Publisher: Prentice

Price: £3.95

Reviewed: David Stephenson

THIS excellent book contains 41 programs for the unexpanded Vic, three for the expanded and one for a Vic with Super Expander and Printer/Plotter. All the programs are accompanied by an explanation both of how to enter and how to play or use them.

They are all dumped from a 1520 Printer/Plotter so all are easy to read and enter. Some include Machine Code routines and User Defined Graphics; they range from simple games like "Dance the Aerial" type to magnificent two-players like "Dungeon King". There are adventures and strategy games and a few Utility programs like Big Letters, Tape Pictures and Piano. For the + 15K Vic user there are three big games: one is a War-game simulation, **Three Flats Wars**; a Klondike type survival game, **Furrow Jack II**; and 3D **The-Top-Top**, and the Vic plays a very good game!

There's also a chapter on UDCs, which gives a very clear explanation on how to both obtain and use them. The authors themselves give you ideas on how to alter the programs within the book, and there is a section on games you might like to consider writing a computer program for, additional reading and a Glossary. Not the usual type where the

various characters are listed, but one where definitions are given. For instance, had you ever heard of Octal? Well, we use the decimal system 10s, computers use Binary 2s and Hex 16s and Octal is a number-basing system using base 8.

The book itself is well

bound, well thought out and I would recommend it for anyone who enjoys game playing and programming on the Vic. You will have fun running the programs and seeing how some ideas could be used in your own programs. Well worth the price.

WIN an Astral Telescope from Dixons

Halley's comet competition

HALLEY'S COMET is coming! And although there's no danger of it hitting our planet, this famous Space Invader will be visible from next year well into 1986.

To make sure you get the best view possible, we're offering one lucky challenger the chance to win a fantastic **Price Astral 400** telescope from Dixons, which retails at £99.99.

The Astral 400 has a magnification of up

to 235X, and comes complete with brass and 28mm eyepieces, a Barlow lens, a sighting scope and diagonal prism and an adjustable tripod with tray.

It's one of the most useful Astral ranges which starts with the Astral 80 at £24.99, and goes up to the Astral 500 at £199.99. All you have to do to win is write a program for the Commodore 64 or Vic 20 (with any expansion) which gives a graphic representation of the course of Halley's comet around the sun, in of your artistic impression of the comet. Then complete the tie-breaker in an apt and amusing manner in 15 words or less: "I want to win an Astral telescope from Dixons because..."

Helix Software of 79 Anderson Gardens, Worcester Park, Surrey, is planning a Commodore 64 version of the Spectrum program **Halley's Comet**, by Sinclair author and astronomer **Maxwell Gaeta**.

For more information on the comet try the astronomy section of your local library or the Junior Astronomical Society c/o Paul Bartholomew, 13 Edwards Road, Putney, London.

Send your program on tape, together with your name and address and your completed

tie-breaker, to Dixons Telescope Competition, Commodore Horizons, 12-15 Little Newport Street, London WC2R 3LD. Enclose a S.A.S.E. if you'd like your tape returned.

The closing date is the last working day of November. Normal competition rules apply, and the winner will be announced in the January issue.

One person alone could go with Pitfall Harry into the Lost Caverns... You!

Oh Harry This time he's gone too far. Somewhere, buried deep in the lost caverns of Machu Pichu, Peru, lies the stolen and, of course, priceless Raj Diamond, along with a hoard of missing gold bars.

Harry's little niece Rhonda and Quickclaw, her cowardly cat, are supposed to be with him, but they strayed away and are lost in the bowels of the caves.

A wealthy university has asked him, while he's clearing this mess up, to capture an elusive stone-age cave rat.

What fun.

He just has to avoid the occasional poisonous frog.

Oh yes. And the wickedly clawed conchors.

The electric eels. And a very nasty line in thirty vampire bats.

So you can see Harry could do with some help. All you'll have to help you are your wits and some gas-filled balloons to bridge the wider chasms. And you'll be in for the game of your life.

One thing puts Activision Software out on its own. The way you go on running it month after month. And Pitfall II is no exception.

Lose yourself in the world of

ANSWER BACK

Relays and m/c

IS IT possible to obtain an interface for the Vic which will allow the control of simple battery-powered electronic circuits, e.g. small DC motors, and will allow information to pass from the circuit to the computer? And where can I find an introductory book on machine code for the Vic? P. Giller, Colwyn, Ireland

THE TIBB VICEKIT, from Datastratics, which connects to the rear port and provides 4 outlet controlled ports max, 24 volts, 18 watts; 2 inlet ports; and a five volt supply output.

If you want to control mains appliances, you will need an opto-isolator as well.

A suitable introduction to machine code on the Vic is the Doctor Watson hardware pack from Honeyfield, Stamford House, Bath Place, Baverly, London.

Expander and modem

I HAVE A Vic 20 with a 16K switchable RAM pack, and would like to add a Super Expander. Will this run at the same time as a two-dot motherboard, or would I need a detachable motherboard?

Also, is there a modem available for the Vic 20? And can you publish a listing for a good, long piece of music for the Vic? I'm sure you have one hidden away somewhere. E. P. Giller/2

Wendell?
No/Yes!

THE SUPER Expander consists of 2K RAM plus 4K ROM located at 9000-9FFF (HEX-ADDR), and is similar to other 2K expansions. You can use your 16K RAM pack as well, but if your detachable pack contains a 2k switch then you cannot use that option, because it will try to use the same space as the Super Expander.

The modem, available through Interbit, Unit C3, Fitzrovia Trading Estate, 8-10 Cookfield, London NE2, Tel 01-489 9947, Interbit's planned Vic 20 modem will cost around £20, but does not have Telecom approval and will not access Private or Mircrom.

As for music on the Vic, there doesn't seem to be a book devoted to the subject, although many general programming guides have sections on sound; perhaps a reader can make a suggestion on this one?

Printer and plotter

I WISH TO delay-chain a 1120 printer - plotter with my disk drive and MPS 801 printer. Is this possible? My main purpose in purchasing a 1120 is to print address labels, with the letters on the 800.

A. J. Searle, South Shields, Tyne and Wear

YES, IT IS possible, because the 1120 has a device number of 6 and the MPS801 is device 4. Your program should open a channel to the 1120 with, say, OPEN#6, and to the 801 with OPEN#4, and then PRINT # 6, "Address labels" and PRINT # 4, "Letters" will output to the respective devices.

If you are using a word processing program, then set the device numbers accordingly.

Loads of errors

SOME TIMES, when loading a program from tape, it stops with LOAD ERROR just before finishing. What is the FEEL location of this error message - would it be possible to POKE the original number back into it, so that the computer thinks there is no load error and carries on loading the program? Jim Donohoe, Devon

WHEN A program is saved to tape, two copies are made by the system, the LOADING

first one copy is loaded, then the second. The two are compared, and if there are any differences you get LOAD ERROR. Eliminating the error message in the case of a corrupted load will not help, since essential parts of the program may be missing.

However, the program may still RUN if the error is not significant. In this case, check if the end of tape pointers agree with the end of program pointers. X and Y should be identical in the following line.

```
X = PEEK#150 + 256*PEEK#  
645 - PEEK#150 + 256*PEEK#  
1010
```

If the listing is complete, and does not finish with garbage, then you can erase the program.

Program generation

I HAVE A 64, and am trying to get it to generate its own programs. It's easy enough to get it to produce 49 lines by printing the lines on the screen then filling the keyboard buffer with RETURNs, then ending the program.

I can generate more lines by making the last "run line" a GOTO line, but the GOTO performs a CLR, losing the data in the array, and since this is where I store the new program data I cannot use this method. Is there any way of preventing the GOTO from performing a CLR after program editing, or any other way of allowing more than 49 lines of program generation? S. J. Franklin, Ceredigion

IT IS NOT the GOTO statement that performs the CLEAR, but the addition of the new lines to your program.

You can get around this problem by POKEing your data into an area of memory which is above Basic, and then PEKING that area when the GOTO is implemented. The POKEs will be in the original program, and this line could be replaced by the line containing the PEKs, by making your first new line number the same as the number of the line containing the POKEs.

You can use a counter location so that you can count the number of lines added, e.g. POKE \$PERCH+1. The CLEAR cannot affect the area of memory above Basic.

Random access

CAN YOU help me with a program which will generate random numbers, then at the end show me how many times each number has appeared? I have an unexpanded Vic, but will soon be getting a switchable 16K pack.

A. Campbell, Ayrshire

The following program will work on all Vics (or any Commodore computer)

```
10 X = RND #RND TO  
2000:THE RANDOM  
NUMBER GENERATOR  
10 0 = 0:Y = RND #1  
#RND TO 100:Y IS  
GOOD PRACTICE IN  
SET VARIABLES BEFORE  
DIMENSIONING ARRAYS.  
THIS SAVES EXECUTION.  
20 PERL = 1 TO 2000  
25 4 = INT #PERL/10 + 1  
30 PRINT 5;  
35 PERL = PERL + PERL THIS  
COUNTS THE NUMBER OF  
TIMES THAT 5 IS  
CALCULATED  
40 NEXT PERL  
45 PRINT "*****"  
50 NUMBER = 25  
55 PRINT "N-APPEARED  
"PERL" TIMES"  
60 PRINT "ANY MORE Y"  
65 PERL = 1  
68 GOTO 25  
70 GOTO 45  
75 END
```

THE RND statements and line 70 need not be entered, and the reason why variables are not set in line 15 is that no RUN variables are created above the program text and before arrays, so that if another variable is mentioned after PERL is executed then the entire array area is moved up in memory, in order to leave the variable in its correct position. This makes the program slower.

If you need help with a technical query or problem write to Jack Cohen, Commodore Horizons, 12-13 Little Newport Street, London WC2R 2JD

A FREE LIGHTPEN!

Yes a **FREE Light Pen!** with every **GRAPHIT!** Graphics is the ultimate in drawing, designing or painting! Using the light pen of course, which incidentally has a full 3 year warranty! Graphics will arrange other things allow you to:

- Draw free handed on the screen anything from a Sticky Mouse to your latest integrated circuit!
- With all the fill colour and erase facilities of course!
- Save/Load your latest master piece to/from the disk tape drive.
- Or directly copy the drawing on the screen to the printer! And keep it for ever or send to a friend as a post card!
- Design your own colourful sprites and characters.
- Play the games in the package! or use the light pen in your own games/simulation/programs.

GRAPHIT! is available on disk and tape. Tape version is £19.95 and disk version (recommended) is **£19.95.**

All your 1540/1541 disk users **DMON!** is here at last. Dmon is the disk monitor you have been waiting for it will allow you to:

- read/write blocks from/to the disk.
- display and edit blocks on the screen.
- display and send disk messages/commands.
- transfer your programs from tape to disk or disk to disk or even disk to tape! • and more!

DMON! comes on CDROM at only **£9.95.**

Do you use tapes? Are you sick and tired of waiting for your programs to be loaded/saved from/to the tape? Then you need a **TORNADO!** Tornado allows you to Save/Load/Verify your Basic/machine code programs faster than a CBM 1541 disk drive does! Due to popular demand Tornado now comes with more and more powerful commands plus extra instructions to assist you in making fast versions of your existing machine code/BASIC programs. Tornado is available on tape for CBM 84 and 85. + Vio 20.

Do your Run/Stop and Restore keys often fail? Do you want to come out of those crashes! Or get into those unbreakable programs! Then what are you waiting for, get yourself a **BREAKER!** Reset switch and let your computer know who is the boss! Breaker can be connected to your machine in seconds, no soldering. Included with the Breaker is a copy of basic recovery software on tape. Now available for any CBM 84 or Vio 20.

If you thought Terrorist was good ...

Programmed by Steve Lee

THE HELL, NOOR engines have produced their first educational device, and have recruited *Danger Mouse* to test it out.

It's designed to illustrate a simple mathematical calculation in straightforward steps.

Danger Mouse walks into the first room with a number (X) written on a piece of paper which also has four columns, A, B, C and D.

Each room contains instructions and directions to the next room. All numbers should be rounded to the nearest whole integer, and the answer appears in column D on exiting the final room.

All you have to do is work out the purpose of the mathematical calculation which the device illustrates.

When you've worked it out, complete the tie-breaker and send your entry with your name and address to *Danger Mouse* Competition, Commodore Horizons, 11/13 Little Newport Street, London WC2E 8JD, to arrive no later than the last working day of November.

Twenty lucky winners will receive two *Danger Mouse* games from Creative Sparks. *Double Trouble* is an arcade adventure featuring all the TV favourites, *Danger Mouse*, *Baron Greenback* and faithful Penfold, in a mad scramble to help the Baron's plan to create a mechanical *Danger Mouse*.

The *Black Parent* Chess is a text-and-graphic adventure which finds DM in a really sticky situation — help you can help him out of a jam!

So the tie-breakers, which must be completed in an apt, original and amusing manner in 15 words or less, is: "I want to help *Danger Mouse* out of a sticky situation because . . ."

Normal competition rules apply.

The winners of the September *Quick&Dirty* competition are 504 Wilkinson of Northampton, Jeremy Porter of Lincoln, Darrell-John Pratt of Chesham, Steve Skinner of Nottingham, William Newton of Oxford, Andrew Cullis of Dorset, Stephen Lewis of Bursley, MJ Hughes of Wigan, Connor Crowley of Galway, Richard Pike of Wakefield, Robert Miller of Glasgow, Andrew Randall of Croydon, Simon Hargreaves of Brompton, Peter Donovan of Brentree, Hugham of Leeds, AS Payne of Beckenham, J

COMPETITION CORNER

Creative Sparks presents

Danger Mouse (and Penfold)

in a sticky situation! Help them out and you could win two new Commodore 64 games!

Coward of Northolt, Marie Gilchrist of Essexworth, SC Nield of Whitechurch, and Tony Hatfield of Henley.

Each will receive a package of the latest games from *Quick&Dirty*.

The winner of the *Headline Books* competition is Colin Bray of Haywards Heath, who will receive a complete set of *Commodore 64* books from the publishers of *Commodore 64* books.

The Mystery Maze

WIN **£25,000** AND SAVE THE WORLD

Eureka!

**350 K OF PURE MYSTERY
BY IAN LIVINGSTONE**

- 3 complete adventures, each with an audio cassette to use with the program. "Eureka" is the simplest computer game.
- Epic in scope, "Eureka" spans five years of history. You battle against the dinosaurs, the bad boys and the big bads, get the laughs of the "Eureka" club, recover from costs, and finally win the final prize of the winners of the Caribbean who is holding you to ransom.
- Epic in their size — there's more than a book for your computer shelf in.

5 PROGRAMS IN ONE

- **MG Adventure** is a word — but you can choose to play them separately. And there will be 10, 14, 18, 22, 26, 30, 34, 38, 42, 46, 50, 54, 58, 62, 66, 70, 74, 78, 82, 86, 90, 94, 98, 102, 106, 110, 114, 118, 122, 126, 130, 134, 138, 142, 146, 150, 154, 158, 162, 166, 170, 174, 178, 182, 186, 190, 194, 198, 202, 206, 210, 214, 218, 222, 226, 230, 234, 238, 242, 246, 250, 254, 258, 262, 266, 270, 274, 278, 282, 286, 290, 294, 298, 302, 306, 310, 314, 318, 322, 326, 330, 334, 338, 342, 346, 350.
- "Eureka" is not just an epic — not just an adventure. After the start of each hemisphere, you'll see an Action level, to decide your straight level for the Adventure's outcome.
- The battle your score, the strange encounter you face.
- And it'll keep you on your toes, with constantly changing, audio and moving graphics, brilliant music and sound effects, audio the excitement.
- As part of the "Eureka" pack, you receive a full colour digipack booklet, containing cryptic notes and mysterious illustrations. Using booklets and screen together, you already know the clues and build up a good phone number party game.
- If you're finishing it, you have the world's oldest book for £25,000.
- Make a package list to give everyone a fair chance, "Eureka" will be received simultaneously worldwide on October 31st, 1984. The package will be available until the date. All orders received by mail or phone by 20th October will be dispatched by post on the 31st night across the world. To order here, include one of the booklets in the mail.

Eureka!

DEVELOPED BY

**DEVELOPED BY
IAN LIVINGSTONE**

The creator of "Eureka" and Ian Livingstone whose "Lightbulb" books have sold over 2,000,000 copies. He's dreamed up some rather silly books and he's now you with this one. Because he's got you covered. The cryptic clues and illustrations in the booklet help you with the program. And because you know the program.

"Eureka" was programmed by Adventureland by Morgan Jones, David Knowles, Graham Gibson. It's the first of a series of 5 "Eureka" books, and the skills of a genius writer, 2 musicians and a professional computer artist will be put to the test. It's a real challenge, and it's a real opportunity, and it's a real chance you were looking for to find it!

£7 BONUS

When you order "Eureka" you will receive a full colour digipack booklet, containing cryptic notes and mysterious illustrations. Using booklets and screen together, you already know the clues and build up a good phone number party game.

Alice

IN VIDEOLAND

NOW
ON
CASSETTE!

PURE MAGIC!

Join Alice in her journey through Videoland - an enchanted place populated by strange creatures such as bread-and-butterflies and pipe smoking caterpillars, where little girls change size and flamingos turn into croquet mallets!

Alice in Videoland is a revolutionary new concept in entertainment for the Commodore 64, incorporating some of the finest graphics ever seen on any home computer, accompanied by a charming musical score. There are four different game scenes involved, and your performance in earlier ones will affect your ability to get through later ones and determine your eventual total score.

Scene One - Stunning title page graphics give way to the first game scene as Alice falls into the rabbit's warren. Score points for collecting the objects to be found there - including keys to open doors, bottles to make her smaller, cakes to make her bigger!

Scene Two - Out in the garden the Cheshire cat looks on as Alice meets the pipe smoking caterpillar. Help her to catch the bread-and-butterflies and the rooking-horse flies that change into the balls used in the croquet game in the last scene!

Scene Three - Alice is a gawin in the chess game where her opponents are the Jabberwocky and Tweedledum and Tweedledee. Help her across the board by protecting her with your White Knight!

Scene Four - The most bizarre croquet game ever! Help Alice hit the balls through the playing-card-soldier hoops before the Queen of Hearts stomps on them!

Alice in Videoland is available for the Commodore 64 on disk - £12.95, and now on cassette - £8.95.

Alice in Videoland features graphics created with the KosMi Pix.
