FEATURES

- **Count on Your Commodore** 7
Your 64 learns to add up.
- **Stop Thief!** 12
Get those programs under lock and key.
- **Interrupts** 32
Introducing IRQ interrupts.
- **The Beat Goes On** 43
Switch on to Syntron's Digidrum.
- **Now Hear This** 44
Rainbird's Music System under the microscope.
- **Gremlin Grilling** 52
Inside a little monster's office.
- **Do You Need Your Head Examined?** 66
Dave Crisp reviews a utility to re-align your disk drive.

SERIES

- **Mach 4** 18
Steve Carrie adds a Machine Code disassembler.
- **Froggy** 40
More to add to your arcade game design.
- **Language Lab - Pilot** 54
Make your 64 bilingual.
- **Build a Better Basic** 62
Your Basic grows still more.
- **Programming Projects** 70
Archaeology and mines do mix.

REGULARS

- **Data Statements** 4
- **Scratch Pad** 10
- **Teacher's Pet** 30
- **In Arcadia** 36
- **Game of the Month** 38
- **Action Replay** 46
- **Misives** 52
- **Sense of Adventure** 72
- **Communications Corner** 74
- **Easy Entry** 84
- **Listings** 87

COMPETITIONS

- **Magician's Ball Competition** 16
A chance to win Global Software's new adventure.
- **Sprite Ideas** 82
Create a sprite and win £10.

GAMES AND UTILITIES

- **Break The Speed Limit** 22
High speed tape for your C-16 and Plus/4.
- **Spike - Programmer of the Year** 56
A great game from a great programmer.

Soft in the Head —

YES, IT HAD TO HAPPEN SOME TIME. Superman has got fed up of doing his quick change act in the confines of a phone box and will now be executing this incredible feat of contortion inside your computer. Beyond has recently launched Superman: The Computer Game, which features Superman, on the side of good, fighting Darkseid for control of a metropolis.

According to Beyond, the game contains a minimum of rules and is punctuated with breathtaking animated sequences. It's not a bird or a plane but it is 1976.

Also in Beyond's autumn release package were *Origamathics*, the sequel to *Shadowline* and *Top vs Top*. The *Island Caput*, sequel to *Top vs Top* (as if you hadn't guessed). Both cost £9.95 on cassette.

Another superman, international goalkeeper Ray Clemence, has got his stamp of approval on Microworld software's new release *World Cup Soccer*. The package contains two programs and a book which provide information on the skills, techniques and secrets of some of the world's top players. Goals Ray commented: "World Cup Soccer is a must for any serious and dedicated soccer fan. Here you've received this you can sit back and watch the 1986 World Cup through the eyes of a real professional."

DATA STATEMENTS

Goalie Ray with the team

Five for under a tenner

Fred and Howard Casey focus on computer by Howard

Demarc, meanwhile, has decided to try and scare us all by launching *Alvin and the Chipmunks: The Computer Game*, featuring a mad feral called Jason who wanders around a holiday camp trying to get his homicidal way with all the innocent campers. Your job is, of course, to save them but mind you don't panic as this seems to infuse the gameplay. \$3.95 on cassette and \$11.95 on disk, probably a game not to be played in the dark. The seller's *Amusements*!

AtariSoft has launched a new range of software for the future which is unusual because the disk versions are under £10—as \$3.95. Frank Bruner, marketing and sales director, said: "The cost may be lower but the quality certainly isn't." The cassette versions are £7.95 and the new titles are: *Axis Assault*, *D-Box*, *Big Shot*, *Salvo* and *Savior Attack*. All are available on the C64.

QuarkSoft has come up with an arcade strategy game for the 64 called *DestinyGate*, which features you as a brilliant (and/or) insane genius who rebuilds your shattered forces so that you can destroy the enemy's special research lab, hidden in the depths of a mountainside. If you don't, they will finish developing the Ultimate Weapon — an atomic bomb. (It isn't some-one already developed!) If you want to gain lost territory from the evil Alliance then you'll have to look out £7.95 for the privilege.

Ultimate has two new titles for the C64: *Dragon Skulls* and *Outlaw* — shouldn't that be *Outlaw*? They both cost £8.95 on the C64 and are embossed with Ultimate's unmistakable brand of art work.

Hewson Consultants want you to let the train take the strain and has Southern Belle for the C64. This steam locomotive simulator is said by its makers to be for the more 'sophisticated' game player and it is rumoured that 'hobbyist' enthusiasts have even been buying computers specifically to sample its delights. Holy smoke!

On to more serious software, and Impen has produced a program called *Font Factory* which is aimed at improving the output from a dot matrix printer. It reads any standard Commodore ASCII file, automatically formats and prints it. And you get a choice of eight different typefaces. It incorporates control of line width and spacing and justification. Also on the disk is a program called *Typ Master* which allows you to produce letters using letters a foot high. You get both programs for £19.95.

Impen has also released *Fantastic Filer* and *Screen Damage 64*. Both these programs are £12.95 each and available on disk only.

In Touch

MICRONET HAS MOVED ITSELF INTO the glamorous world of pop music. Fred Gal Shanks appeared on *Celebrity Challenge* and was greeted with an enormous response from Micronet members.

Fredgal has himself been a member of Micronet for over a year and is very impressed with the service, saying, "Most of all I find it good value for money." He also loves the *Celebrity Challenge* in particular, "I think it's very entertaining," he says. "It's certainly a lot more entertaining than most of the programmes on TV at the moment. I'd rather watch *Charlie* than *Conan* on street." Obviously an *Amusements* fan.

Micronet members have also been making an effort to help the survivors of the Mexican earthquake. In the last month of the Mexican Aid Appeal they raised over £100. Donations should be made payable to Mexican Aid and sent to the address below. Micronet members should call page 7600119836.

No more tangled wires

Teletext Adapter for the C64

New Philips monitor

Hard Lines

MOSELEY ELECTRONICS HAS NOW announced the availability of a Teletext Adapter for the C64. The C64 version of the Adapter plugs into the user expansion port and uses software to produce a simulated teletext display.

The Commodore version costs about £138 and anyone interested should contact Mosley for more details.

There's also a new range of colour monitors now available from Philips. These are fast models in the range and priced at £228.

Philips policy is to improve the clarity, resolution and performance of monitors to keep in line with improvements made

to home computers. Philips state that the monitors are designed to give superior quality and response for easy comparing need.

Generally Speaking

FREEBIRD HAS NOW GOT A BABY SISTER—or should that be egg. British Telecom is forming a new software company, which will be totally separate from Freebird. The new entity is to be called Rainbird and will be headed by its namesake Tony Rainbird.

First release from Rainbird is Island Logic's, *The Music System*. It has been available for the BBC computers for some time, but only now has a Commodore 64 version been perfected.

Rainbird will also be producing software for 16 bit computers including Commodore's latest little offering, the Amiga. Freebird will continue to burn brightly and independently producing games for 8 bit machines.

For those who are concerned about the function of the new Data Protection Act 1984, the Data Protection Registrar has produced a handy question and answer booklet to try and clarify the most important points. The Act is designed to protect individuals' rights by allowing them to have access to personal information which various organisations may have on file. Subjects covered range from personal data held at schools and universities to registration for groups of companies.

It won't be fed up with seeing those horrible tangled up wires around your computer, then Comstock Electrical Limited may have come up with the solution to your problem. Now available are two new adapters, one of which can take up to six plugs, the other up to four. Both are smaller and lighter than traditional ones and they certainly look a lot better, too.

Both come complete with plugs and are for use in any standard 13 amp socket. They also conform to the Electric and Equipment Safety Regulations 1985.

In a mathematical special, Nick Hampshire shows you how to use the CIA's arithmetic routines.

Numeric Variables, Types and Range

BASIC USES TWO DIFFERENT types of numbers, integer and floating point. An integer number is stored in two bytes giving a 16 bit signed number which can store numbers in the range +32767 to -32768. Floating point numbers require five bytes and can store much larger values in the range 1.7094183E28 to 1.7094183E-28. In the Basic interpreter all calculations, whether on integer or floating point values, are performed using the latter rather than simple integers or binary values. Consequently, all integer values are first converted to floating point format before any calculations are performed.

The format for the storage of an integer value is very simple, consisting of two bytes stored in low order/high order byte. Negative values are stored in a two's complement form, — the format is shown in Figure 1. Floating point values are stored in either packed form, occupying five bytes, or unpacked form in six bytes. Packed format is the normal mode for storing floating point

variables in memory. Unpacked format is used when performing calculations upon floating point values. In either format there are three components of a floating point value, — the sign, the exponent and a four byte mantissa. In packed mode the sign is stored as bit seven of the most significant byte of the mantissa. In unpacked format the sign occupies its own byte.

The Floating Point Accumulator

In order to perform arithmetic operations on any floating point value the interpreter needs temporary storage locations for the values being worked upon as well as the result. These are two principle work areas, they are known as

COUNT ON YOUR COMMODORE

floating point accumulator 1 and floating point accumulator 2. These names are usually shortened to Fac 1 and Fac 2. Each floating accumulator occupies six bytes and Fac 1 starts at \$41 while Fac 2 starts at \$5. There are, in addition,

three further areas where floating point numbers in packed format (occupying five bytes) are stored. These areas start at \$07,\$0C, and \$8. The format and location of the two floating accumulators is as follows:

Locations	Function
Fac 1	
\$41	exponent + \$80
\$42	mantissa byte 3
\$43	mantissa byte 2
\$44	mantissa byte 1
\$45	mantissa bit
\$46	sign (\$47 = - and \$48 = +)

 907 — sign comparison byte
 910 — rounding byte for fac 1

How a Floating Point Number is Stored

The storage of a floating point number is fairly complex both in packed and unpacked format. The data used to store a floating point number can be divided into three components: the exponent, the sign and the mantissa. In the unpacked format, the exponent and sign both occupy one byte and the mantissa four bytes. The following is an explanation of each component of a floating point number.

Exponent — The exponent indicates the position of the decimal point within the number. Six seven of the exponent byte indicates the sign of the exponent. Thus, if the exponent is positive, bit seven is set to one and, therefore, the value of the exponent byte will always be greater than 128. If the exponent is negative then bit seven is set to zero and the exponent value is less than 128. The exponent is stored as a power of two and is multiplied by the mantissa value to produce the final value. The following formula can be used to convert a number N stored in the mantissa bytes one paragraph on number for calculation of N) into the full floating point number by multiplying it with a positive exponent:

$$\text{Value} = N * 2^{(E-128)}$$

To determine the exponent of a number, find the highest power of two which can be subtracted from the number. Thus, if the number is 18,29 then the highest power of two is 16 or 2⁴. The exponent value is positive, and therefore equals 1294 or 131. The fact that the exponent is derived in this way means that the mantissa for two different values may be the same, with the difference being registered solely by the contents of the exponent. Thus, the floating point mantissa contents for the values 3.14159 (p4) and 6.28318 (p2) are identical:

3.14159 stored as — exponent 130 and mantissa 73,75,278,761
 6.28318 stored as — exponent 131 and mantissa 73,75,278,761

As you can see, multiplying and dividing a floating point number by two is a very simple operation involving adding or subtracting one from the exponent. The range of the exponent is a 255. This equates approximately to 1 to 10¹⁶.

Sign — The sign of the value is stored in unpacked — format as a single byte with a value of 047 for negative numbers, 040 for positive numbers. In packed format the sign is stored in bit seven of the highest byte of the mantissa. If bit seven is zero then the mantissa is positive, and if it is one then the mantissa is negative. Thus the unpacked floating point values for +2 and

-2 are:

number +2 is — exponent 130 and mantissa 60400
 number -2 is — exponent 130 and mantissa 128,04,0

Mantissa — The mantissa is stored in four bytes less the most significant bit of the most significant byte of the mantissa which is used to store the sign bit. To convert a number stored in the mantissa into its numeric

Program 3

equivalent; use the following formulae:

$$N = 16(M1 \text{ AND } 12) + (M2 - M1) \\ + (M3 - M2) / 256 + (M4 - M3) / 128$$

where M1, M2, M3 and M4 are the mantissa bytes, with M1 the highest and M4 the lowest. When N has been obtained it should be multiplied by 2 (program — 128) to give the actual value. The program in Program 1 allows the input of a number, then prints the contents of the exponent and mantissa bytes for that number as it is stored in floating point. These values are then used by lines 90 to 126 to convert the floating point byte values back into the number.

To convert a number into floating point form is a slightly harder calculation and involves the following steps:

first find the highest power of two which can be subtracted from the number, $k =$ the value of two to this highest power, secondly let $R =$ the remainder after subtracting the value of k .

The calculation is then as follows:

$$T0 = (R) * 128$$

$$M1 = INT(T0) + \text{mantissa sign} \\ (\text{sign} = 0 \text{ if positive } 128 \text{ if negative})$$

$$T1 = (T0 - INT(T0)) * 256$$

$$M2 = INT(T1)$$

$$T2 = (T1 - INT(T1)) * 256$$

$$M3 = INT(T2)$$

$$T3 = (T2 - INT(T2)) * 256$$

$$M4 = INT(T3)$$

Where M1, M2, M3, M4 are the four mantissa byte values, M1 being the highest. The program in Program 2 does this conversion of a number input at the beginning of the program into the four bytes of a floating point format which are displayed on the screen. The program then checks by putting these values into the first variable in memory defined as a simple variable A in line 10.

The following are examples of the storage of some floating point numbers:

Number	Exponent	M1	M2	M3	M4	Sign
1	0H	000	000	000	000	000
-1	0H	000	000	000	000	0FF
.5	80H	000	000	000	000	000
.25	40H	000	000	000	000	000
11.28	47H	096	076	094	072	000
11.28	50H	0A0	000	000	000	000

Table 1

Using the Arithmetic Routines in a Machine Code Program

Using the arithmetic routines within the Basic Interpreter can save the programmer a lot of time in program development. It can also considerably reduce the size of a machine code program. The only penalty is that in the program using eight or 16 bit values the interpreter routines will have a considerably slower run time than specially written routines. When faced with the necessity of having to use arithmetic

routines the best procedure is to always use the interpreter routines and only replace these if the program is running too slow. A list of the main arithmetic routines within the C64 is shown in Table 1.

It is quite simple to utilize the interpreter arithmetic routines within a machine code program. The essential thing to remember is that the interpreter does all its calculations on floating point numbers, therefore all integer values must first be converted to floating point. The following is an example of a routine using the interpreter arithmetic routines:

$$\text{calculation } C = (A * 25) / (B * 5)$$

Where values A and B are both positive assigned 16-bit integer values these are both input from the keyboard at the start of the beginning of the routine

and the result C is a five byte floating point value which is both stored in memory and displayed on the screen.

Variable storage locations in memory used by this routine are:

0000 — 16b of value A
 0001 — 16b of value A
 0002 — 16b of value B
 0003 — 16b of value B
 0004 to 0006 — temporary floating point value storage 1
 0009 to 000D — temporary floating point value storage 2
 000E to 0011 — floating point result C storage

This article extracted from the following books and readers are recommended to consult them for further information — Advanced Commodore 64 Basic Revealed and Commodore 64 ROMs Revealed both by Nick Callaway and published by Callias.

Scratchpad

This month K Frost provides a couple of very handy routines for use on all machines.

HOW OFTEN HAVE YOU wanted to put a scrolling message across your screen? You know the type, they are used in most games programs to give instructions or a witty message. The first routine does just this. It is written in Basic but nevertheless is quite fast and would be very easy to include in your own programs as a sub-routine.

All the routine requires is that the message to be scrolled is held in the string *AS* and the positioning of the string is held in *IX*, i.e. *IX* should hold a base and a number of cursor movements.

The 18 in the *AND* statement is the width of the message window. This can be any size but don't forget if you go over 40 the message will wrap over more than one line on the screen.

All Things Bright

The second routine is one that will display a message and flash the letters of that message in different colours. This is very good for messages such as 'PRESS ANY KEY TO CONTINUE' or 'SPACE TO PLAY'.

Again the program is in Basic and you can easily add it as a sub-routine to your own programs. The message that you wish to colour should be held in the string *AS*. It holds all the colours, through which you wish the letters to cycle. An experiment with this is some very interesting effects can be achieved.

PROGRAM: COLOUR / K.FROST

```
100 PRINT"CLEAN":REM COLOURS

how to foil the
program pinchers.**

SITTING ON THE THIEF

AFTER SPENDING MANY A sleepless night and countless day creating and debugging your latest computer masterpiece, it's disconcerting to know that any Tom, Dick or Harriette can rip it off in seconds flat. In the past many methods have been suggested to prevent LISTING, but few are satisfactorily secure.

The four most common methods prevent the list function from operating properly but only one of these works after the program has been RUN.

Firstly, there is the simple expedient of using a shifted 'L' as a REM statement or the first line of your program:

```
L REM [S L]
```

Trying to list to a printer causes it to hang up after the REM and the normal command LIST merely produces the following:

```
REM  
SYNTAX ERROR!  
READY
```

To undo this protection it is merely a case of deleting line 10 and then the program can be freely listed by anyone. Not very secure.

The second method only protects one line of a listing and also uses the protection of the REM statement. The easiest way to see this in operation is to enter a line such as

```
10 PRINT"HELLO" REM
```

Press the return key to enter the line and then move the cursor to the space after the quotes. Press the shifted delete key (DEL) four times and then press it again four times unshifted (DS). This should give four reversed letter I symbols. Next type GOTO 10 and press return.

If you use LIST the one-line program you should see

```
10 PRINT"HELLO" GOTO 10
```

As there is no line 10 an error message would be

expected but when this program is RUN it executes normally with no error. All that has happened is that the REM part of the line has been masked by the delete symbols and the GOTO is still seen by the operating system as being within a REM statement. When the system tries to LIST to the screen, the deletes are executed and the effectively pulls back the GOTO over the REM. On a printer the trick is revealed because each delete is shown in its original form as a reversed I.

Instead of the inbuilt INDT/DEL routine, just pressing R/S/DS and the letter I gives the same effect but with less fiddling about.

Adding more deletes pulls the GOTO further back along the line and experimentation will show that the command can be pulled back over the line number and even on to the previous line.

This is useful because it can be used in conjunction with the first list protection method to disguise its presence.

```
17 PRINT"HELLO"  
21 REM"147" GOTO 180  
REM"175 L]
```

This apparently only lists a line 180 on the screen and gives a SYNTAX ERROR! message. The fake line 180 could succeed in putting most people off the score and using line numbers which are not divisible by 10 would make detection of the coded lines difficult. On a printer the trick is revealed as the deletes are shown in their original form as reversed Is.

Instead of the PRINT statement in line 17 you could use a PRINT statement which looks for the shifted I in line 21.

To find the location of this character (well) the following line:

```
17 IF PEEK(XXXX) <> 204  
THEN SYS 6478
```

Now enter the following in direct mode (no program line number)

```
FOR A=2040 TO 5000 IF  
PEEK(A) <> 204 THEN  
NEXT
```

When the error message type PRINT A and monitor line 17 with the number obtained (2040) in place of (XXXX). Repeat this line somewhere deep in the rest of your listing and hide it using the next method of protection. Remember that whenever line number is used for the two lines at the beginning of the program, the position of the shifted I will not move.

The third method takes advantage of the way a line of Basic is seen by the operating system. A line consists of two bytes which give the memory address of the start of the next line, two bytes giving the current line number and then the tokenized code for the Basic instructions, followed by a null (zero) byte denoting the end of the line. When a line is listed the null byte is used to tell the system to start a new line, not the two byte pointer to the beginning of the next line. We can fool the system into jumping to the next line during a list by inserting a null byte where it least expects it causing the list to prematurely jump to the next line without listing the Basic code in the current line.

After writing your program, decide which line you want to hide and place any five lines

at the beginning of the line

```
10 GASSPRINT"HELLO"
```

Next insert a STOP at the end of the previous line or insert a new line which contains solely a STOP command:

```
1 STOP  
10 GASSPRINT"HELLO"
```

RUN the program until the stop is reached and the familiar break message is displayed. At this point the system has stored the memory location of the next line (as in case COUNT is used, locations 41 (S02) and 42 (S03) contain these pointers so the start of the line is given by the formula PEEK1 PEEK (42) + 256*PEEK(41). In the example the value would be 3000.

To avoid upsetting the line link and the line number add five to this value and paste the location given with zero (POKE 2040,0). The dummy STOP command can then be deleted and a LIST will show only the line number of the hidden line whether listed to the screen or a printer.

For the final method of list protection we need to know a little about the way in which the 64's memory is organized. Locations 750 (S000) to 799 (S039) mainly consist of jump vectors for some of the main BASIC routines like LOAD, SAVE, BREAK and, more importantly, LIST. A vector is a two byte number which gives the location of the start of the in-built machine code routine which performs the relevant task. For example, a memory map gives the LIST vector as being in location 776 and 775 (S007-S007). Change either of the values found in these locations and the LIST function will be disabled causing all

```

manner of things to occur if the command LIST is used, inserting a line at the beginning of your program such as:

```
IF POKED(4000,POKE(4000,0))
```

would result in a system error if LIST was attempted. Changing these values to 121 and 164 respectively would apparently cause nothing to happen.

One word of caution, I've all in favor of experimentation but be warned: never play around with vectors if you have something valuable in the memory, you'll lose it!

All these systems have a common fault: they are all easily circumvented once located. What is needed is a program which will run automatically and again we need to look at the vectors in the light of how the operating system leaves the LDMS command.

A call is made to the vector jump at location 770 (A000) which causes a warm reset of the system. If this vector is changed to cause the newly loaded program to run we will have achieved our aim. But how can this be done?

First we must check that the memory locations which define the start and end of the program are correctly printed and that the next pointer is set to the beginning of the program. Fortunately, this can be done by calling up a routine in the Basic ROM located at 4100 (A400) and then a call to 4104 (A404) will cause the execution of the program. This means that we have to place a short routine into the memory and point the warm start vector to the start of the routine.

Finding a place to store the autostart routine can be fraught with problems because it must stay in memory to keep the program re-running.

The cassette buffer must be avoided in case the program needs to access the recorder for any reason, but below this buffer are eight consecutive bytes of free memory which will house our six byte routine comfortably.

```
DATA 1# 1A00
DATA 1# 1A70
```

Two bytes of the warm start vector can now point to this routine and because the warm start is called up by the

RUN/STOP-RESTORE routine the use of the RUN/STOP key will result in the program restarting from the beginning.

To ensure that the autostart will work, a vector, called from the CHRGOUT vectors at 800(520), must be placed into the cassette buffer to allow the vector at 770(A000) at the end of loading. When the system tries to print READY, it jumps into the vector which changes the warm start vector. All of the memory from 70 to the end of your Basic program is saved after the CHRGOUT vectors have been changed.

Obviously, you cannot change the vector without using a machine code SAVE routine. The one included here starts off with a Basic program which stores the details of the load and save devices and filenames. This jumps into a machine code routine which loads the program which you want to protect, displays a suitable loading screen and places the autostart details in memory. A save is then performed and a cold reset is performed allowing you to try your new autoloading program out.

The Basic loader program includes a save routine. To set up your Stop Third! master enter and save the loader program on a spare tape or disk. Type in and save the Stop Third! Master program and then load and run the Basic loader (so that it stores the program immediately after the Master program if you are using tape).

When using Stop Third! load the Master program and run it. This automatically loads the machine code program. Although you will receive a prompt, make sure that the tape/disk containing the program ready for conversion is in the recorder/disk.

After loading, suitable prompts will appear to enable you to successfully save your autostart program and disk users should not be too concerned about the fact that the saving screen proclaims that it is loading the program. Remember that this screen will be saved along with your program and therefore will become your loading screen.

The results of your labours will be unbreakable Basic programs...well almost!

A Flash Of Genius!

THE NEW 64 MULTIMODEM

**GIVES YOU DATABASES, BULLETIN
BOARDS, ELECTRONIC MAIL,
PRESTEL — ALL ON YOUR
COMMODORE 64 OR 128**

At last! The perfect modem for your Commodore™ 64 or 128, giving you access to Prestel™, Microwet™, viewdata and a host of other services — plus user-user communications. It couldn't be simpler. The 64 Multimodem has auto-dial and auto-answer, with all communications

software on-board in ROM. 64 Multimodem fits your Commodore's cartridge port, and has just one external connection — the telephone lead.

The 64 Multimodem is menu driven and multispeed, with CCITT V31/23 and Bell 103 standards, handling baud rates of 300/300, 1200/75 and 75/1200. Functions include save and print frame and automailbox with edit and save.

Buy your 64 Multimodem now and we'll give you free introductory subscriptions to Microwet and Microdisk™ in an unbeatable package of an unbeatable price — it's pure genius!

COMPETITION

Make magic with this month's prizes from Global Software.

THERE'S MAGIC IN THE AIR AND mischief too in Magician's Ball from Global Software. If you want to improve your spelling then study the illustration on this page and see if you can find one of the lucky spells to enter an enchanted adventuring world. If you want to find out more about the game then turn to *Game of Adventure* for details. There are 20 copies of the game to be won and the top five entrants will also receive a copy of Global's *Caravans* program.

How to Enter

STUDY THE ILLUSTRATION ON THIS page. Look very carefully as there are several enchanted balls hidden in the picture. When you think you have found all the hidden balls, circle them clearly.

Fill in the entry coupon carefully and seal it in an envelope, writing the number of balls you found on the back.

Send your entry to: Global Software Competitions, Your Correspondence, No 1 Golden Sq, London W1R 3AB. The closing date is Friday 20 February 1988.

You may enter as many times as you wish but each entry must be on an official coupon and sealed in a separate envelope.

Important: Please follow closely the guidelines on entering - incomplete coupons and entries with no number on the back cannot be considered.

The Rules

ENTRIES WILL NOT BE ACCEPTED from employees of Argus Specialist Publications, Alhambra Publishers and Toys and Global Software. The restriction also applies to employees' families and agents of the company.

The How to Enter section forms part of the rules. The editor's decision is final and no correspondence will be entered into.

MACH 4

Steve Currie adds a machine disassembler to the Mach I monitor.

IN THIS ARTICLE, I WILL GIVE listings of the MACH I monitor extension and also some information on the whole MACH series of programs.

The extension adds a disassembler to the normal monitor commands. When the Basic program is RUN for the first time, it will patch the disassembler into the normal monitor code. Note that it replaces the I command (alarm reset), so you will not be able to use the warm start facility (a similar effect can be created by issuing a G-8000 command).

When you have typed in and saved the extension listing, place a disk containing the original monitor program in the drive that RUN the program.

First, the extension code is placed in memory at address 7000 hex. Each line has a checksum, if a data error occurs, the program will print the numbers of the line where it was detected. This checksum isn't 100% effective since one error may cancel out another so be careful!

Next, the original monitor code is loaded in at its usual address of 8200 hex. A series of POREs patch the extension into the main code. These changes are as follows:

- 1 Change the I command to D and reset execution vector.
- 2 A section of code in the original monitor which sets the top of memory is altered to sit at address 7000 hex.

It also start-up message vector. Finally, the whole program is saved to disk under the name of MACH4DM. When you are sure that everything works OK, you can replace the original MACH4DM file with this new version.

When the SAVE is complete, type SRS 4070 to reset the machine (plus I switch the machine off) then enter the monitor with SRS 8100 (unchanged). In addition to the usual startup message, you should see another one similar to:

```
MACH I EXTENSION
VERSION 1.5
(C) OCTOBER 1985 S.D.C.(A.C.)
```

Now, if you type D ASB < return > the disassembler should print out the contents of one of the ROM routines. Note that this command automatically sets hex I/O mode.

You should note that there is now about 16 less source code space for the editor which will leave about 80K.

The Monitor Jump Table

When I wrote the MACH series, I decided to put some of the more commonly used routines into the monitor. A jump table was provided at address 8200 hex to access these routines. Note that the monitor is always present, a program only had to know where to call the required jump. A fair chunk of memory was saved using this method. In fact, looking back on it now, a lot more could have been saved.

The names of the routines and their call addresses are

given below.

Name	Address
START	8200
SAVE	8203
LOAD	8206
NAME	8209
OUTADD	820C
OUTVAL	820F
RET	8212
FINI	8215
CRCHES	8218
CRCHNUM	821B
CRCHVAL	821E
NET	8221
COPEN	8224

Function
WARM START
SAVE TO DISK
LOAD FROM DISK
NAME INPUT/NAME
OUTPUT A BYTE NUMBER
OUTPUT A 2-BYTE NUMBER
INPUT A CR-11
INPUT EXTENSION
CHECK ACC. FOR MACH4
CHECK ACC. FOR NUMBER
CHECK ACC. FOR ALPHA
SET INTERNAL PARAMETERS
OPEN OR ERROR CHANGE

A JIR to the appropriate address should be used since each routine ends with RTS (except START).

Some are more useful than others. A more detailed description follows. Note that TRIPTR is the CHECKED test pointer at address 7A hex and TR is the terminal input buffer at address 8200 hex.

START — This simply vectors to the code for restarting the monitor. It is a non-returning routine which resets the M00 system stack. This is normally used by an external command to return control to the monitor (see INTERNAL COMMANDS). This is also the address 8200 used by the Basic start-up call.

SAVE — Save memory to disk. At entry, TRIPTR must point to an ASCII string in TR which has the format:

```
filename < address1 > < address2 >
```

This is the same format as the monitor I command. Any error causes a jump to the error handler. On exit, TRIPTR points to the end of the string 1. This routine sets a logical file number of 1. Note that the Basic ROM is switched out to allow the area 8000-89FF hex to be saved too.

LOAD — Load from disk. On entry, TRIPTR points to an ASCII string in TR with format:

```
< filename >
```

This is the same as the monitor I command. Any error causes a jump to the error handler routine. On exit, TRIPTR = end of string 1. Use logical file 1.

NAME — Name filename. On entry, TRIPTR points to an ASCII string in TR which represents the filename. At exit, registers are as follows:

1 = length of filename string
V = start offset of string in TR
TRIPTR = end of string + 1

This routine uses spaces as delimiters. An error is given if string exceeds 50 characters.

OUTADD — Output a 2-byte ASCII hex as decimal string. On entry, TR contain the 16-bit value to be printed. The output mode (hex or decimal) depends on the flag OUTMODE (address 82AF hex). If OUTMODE is zero, output mode is decimal otherwise it is hex.

OUTVAL — Similar to OUTADD except an 8-bit value

in the accumulator is used.
BET — Simply outputs a 2x8 combination to the current output device.

EVAL — Evaluation expression. On entry TXPTR points to the start of the string. The flag OUTMODE operates in the usual way. Errors will be incurred if either the number is out of range (0-255) or illegal characters are found.

Note that this routine also checks for the apostrophe (') which puts EVAL into ASCII mode regardless of OUTMODE. On exit, TXPTR points to the end of the string "+".

CHECK, CHNUM, CHNUMU — These three routines check the accumulator for an ASCII hex, numeric or alpha numeric character respectively. If not, a carry flag set indicates a valid character.

SET — Set filename parameters. On entry TXPTR points to the start of a filename in TAB. On exit, ETERNAL routine (SETNAM (FPO) hex) is

called and TXPTR = end of filename + 1.

COMP — Opens disk device if error channel 15. No input parameters. There is no OUTMODE call. A file close may be accomplished using the following routine:

```

LOCATE TO (COPEN USES OPEN TO
(OR SPOK) ; ETERNAL CLOSURE
CLOSETIME

```

Put simply, an external command is one whose code is not resident in the MACH system. Internals normally occupy the area from 9000 to 9111 hex but may extend up to 9111 hex if the Basic ROM is switched out. If you use this method, remember to switch the ROM back in before calling START to return to the monitor.

When the external has finished executing, a DAF START allows the monitor to regain control. The actual call address of an external is 9000 hex.

The programs MACHRO and

ASSEMBLER are external. Often, if the external you want to use has already been called it may have been the last external called, a C 900 command will provide a quicker method of execution. This is because an external remains resident after execution i.e. it is not deleted from memory. This is true until another external called or the C command is used to clear out this section of memory.

The Macro Processor Bug

And now, the bug! I discovered this while using the MACH system. It will only affect you if you use the macro processor on large source files containing macro calls. Basically, when the macro processor is constructing the output file, it uses the available memory from 800 to 7000 hex. Due to a programming oversight (a nice way of saying I made a mistake) a check is made

to see if this file is overflowing into the area above 7000 hex. The processor will quite happily destroy itself!

If the application you are working on needs no macros then you can leave out the macro processing altogether and submit the raw code to the assembler.

Unfortunately, there is no easy way to tell when an overflow will occur. As a guideline, if your source code occupies more than about 25k and contains calls to some really big macros then you may run into trouble but I think about 90% of the time you will be OK. Sorry about that!

I have tried to make the MACH system reasonably versatile by including the external command facility. If anyone has any comments, questions or ideas on the system, I would be glad to hear about them. Write to Steve Carnie, one Year Commodore.

**A GIFT
12 TIMES
A YEAR?**

FOR JUST ...

£13

NORMAL RATE ... £16.60

A subscription to **YOUR COMMODORE** magazine is a gift twelve times over! Whether the subscription is for a friend, relative or a treat for yourself, **YOUR COMMODORE** provides the reader with the latest information and developments on the Commodore range of computers.

Delivered each month straight to the comfort of your own home, could a Commodore enthusiast wish for anything better?

(This offer lasts until 31.2.86 and applies to readers in the United Kingdom only.)

SUBSCRIPTION RATES

Readers overseas (excluding Europe) post: £21.60 or US \$33.00.
Readers overseas (all other) £17.00

Please return the completed form to:
Your Commodore (Special Offer)

This high speed tape operation for the CH and Plus/4 will cut down that tedious waiting time. By Nick Hampshire.

BREAK THE SPEED LIMIT

A FAST LOADER IS A ROUTINE WHICH replaces the existing LOAD and allows a program or data to be loaded from tape at about 10 times the speed of a normal LOAD so a tape can be as fast as a disk drive.

A fast loader is achieved by simply changing the format of the pulse sequence stored on the tape to allow a far greater density of information storage per inch of tape.

In order to create a fast load program two routines are needed. Firstly, a fast LOAD routine. This is a fairly short machine code routine loaded at the beginning of a LOAD operation and autorun to LOAD the rest of the program and/or data stored in fast loader format. The second program required is a routine to SAVE a program in fast loader format: the fast SAVE routine.

The first major problem to be overcome in designing a fast loader is how to store each bit on the tape. Each bit is stored on tape as a pulse which goes through a high-low transition (see Figure 1). The length of the total pulse divides whether the bit is a 1 or 0. Short pulse is a 0 and a long pulse is a 1. The bit is flagged in the interrupt register on the falling edge of the pulse.

The loader is a machine code program which runs with the interrupt disabled, sets a timer between the two lengths, and when the timer runs out the interrupt register is flushed to see if the pulse came in or not. If the falling edge of the pulse generates an interrupt before the timer runs out then the pulse was a zero; if not, it was a one. The bits are then rotated into a byte storage (until eight bits have been read), thereby loading a full byte.

Before any bytes can be read and stored, the loader must set itself to be in sync with the bits on the tape. This is done by writing a string of 8 bits with a single 1 bit at every byte interval. The routine then tries to align itself by recognizing the value of the byte. An example of a header byte for aligning would be the value 04 hex (04 or in binary 00000100). A series of these bytes is written as the header. Only when this byte has been read in and recognized can the actual program be read without risk of alignment errors.

The program is written in different ways depending on how much program protection is desired. The simplest way of protecting the file is to fast SAVE the two byte load address, followed by the two

Figure 1

byte end address and then the actual file. The final byte following the end of the file is a checksum calculated by the SAVE routine and it's also calculated during loading. If the two values are the same, the LOAD was successful. The routine for this form of fast loader is given in Program 1.

Fast tape routines — making them work

Putting the theory into practice to create the fast LOADER routine is not difficult. The actual timing for the SAVE routine was not calculated from any theoretical formula but was obtained merely by trial and error. The only guidelines were that the short pulse should be slightly shorter than half the long pulse, since the waveforms of the pulse is created out by the concrete hardware. The string value used by the loader is just shorter than the time required before the long pulse reaches its falling edge.

The high-speed tape routine will SAVE a Basic program to tape in fast format and automatically put the fast LOAD routine into the filename where it is stored and, when loaded, will automatically start on the warm start sector. The routines are installed by SYS/DISK. A Basic program can be fast saved by using the SAVE command as normal but with a device number of 7, thus:

```
SAVE PROGRAM 7
```

In addition the fast LOAD also makes use of the secondary address to autorun a program, thus:

```
SAVE PROGRAM 7,1
```

This will cause the program to autorun when loaded back. With both routines, when a program has been saved using one of these fast loader SAVE routines it is unnecessary to LOAD anything before the program; it will LOAD directly from the LOAD command.

Program Listing 1

TROJAN CAD-MASTER

THE ULTIMATE IN GRAPHICS TOOLS

SUPERB GRAPHICS SOFTWARE PLUS A TOP QUALITY LIGHT PEN

Discover the exciting world of creating your own graphics on screen.

- **FREEDRAW-DRAW** - 5 pen thicknesses inc. Quills
- **PAINT SPLASH** - for the artistic touch
- **FILL ANY SHAPE** - over 10 colours and 11 patterns.
- **GEOMETRIC SHAPES** - circles, boxes, triangles, lines & shading.
- **DYNAMIC FLAMER-BANDING** on all geometric options.
- **PIB-POINT FUNCTION** - for pixel accuracy on all functions.

Plus many more too numerous to mention in this ad. All these features in the Program - a top quality Light Pen and an instruction booklet in one reasonably priced package. Easy to use for creating colourful pictures or technical drawings. Ideal for use by all ages of micro-users. Full back-up service from manufacturers. Available at good dealers or direct from Trojan Products.

Only £219.95 per pack

Electronic Aids (Tewkesbury) Ltd.

Accounting and Educational Software

For Commodore 64 and 128

SALES LEDGER with Invoicing **£99.00 + VAT**
Invoices tied-out to your own design, statements, aged analysis, daybook, period and VAT report, label printing etc. etc.

FINAL ACCOUNTS **£60.00 + VAT**
Nominal ledger with inputs for sales, purchases, cash and journals, allows you to structure your own reports eg. profit & loss, balance sheet, departmental reports. Complete auto trial, trial balances, opening balances, last month's trial balance, monthly totals on all accounts etc.

PURCHASE LEDGER **£60.00 + VAT**
Sales ledger, purchase ledger and final accounts (as above) all combined into one integrated package.

INTEGRATED ACCOUNTS **£195.00 + VAT**
Sales ledger, purchase ledger and final accounts (as above) all combined into one integrated package.

SEVENPACK **£49.20 + VAT**
A simple integrated package for very small businesses. Purchase & Sales Control, invoicing, simple nominal ledger, statements, ordinary stock control, stock control for car parts and address label printing.

PAYROLL with new NI rules **£99.50 + VAT**
Easy to use, but allows 7 user/employer/contract SSN, 4 pre-fix adjustments incl. SSP, 8 after-tax adjustments, deduction card, coverage analysis etc.

Teacher's

Margaret Webb goes back to school and learns about Basic.

BEFORE LAUNCHING FOURTH month - a small confusion. I've been writing this column for several months now and though the teaching qualifications are verifiable, the same cannot be said for my programming skills. I therefore decided that it was about time I rectified the situation by learning how to program in Basic. It was discovered that this is not as easy as it would seem, the first question is to establish the best method of learning. Three approaches immediately spring to mind.

The first is to sign up at a local school or college for night classes. These are available for a number of languages with a bias towards BBC Basic. There are a number of snag however. Night classes are limited to the older age groups making them unavailable to youngsters. They also cost money.

If you want to use this route, you are constrained by a fixed timetable and term lengths. You must also learn what the teachers choose to teach, some teachers have a strange idea as to what material a student needs. My class is currently struggling through the mysteries of binary and hexadecimal as part of her course on Basic! If she was learning machine code I could understand it, but not for Basic. It's a good idea to find a course which offers some practical work as well as lectures so that you can get hands on experience with the help of the teacher.

A second approach is to find a home based course and work through it under your own steam. The alternatives are either a correspondence course, if you can find one, or a book/software package. The main drawback with this method is that if you get stuck, you don't have anyone to bail you out.

Alternatively, you could find a tutor. There are always knowledgeable enthusiasts around who would spend some time passing on information for a small sum. The problem is finding them.

Probably the best approach for most people is to combine the latter two.

This month I intend to look at a number of books/software systems currently available.

Most of you will have discovered the lack of help provided when you buy a Commodore machine. The C-16 does come with a Basic tape but this is more of a wire gimmick, the actual manuals are next to useless. This is where damage where you consider the tuition provided with other products. Many manufacturers of learning machines and musical instruments provide lessons or other teaching

Pet

material included in the price. Why run's computer manufacturers do it well!

One small word of warning. A large number of publishers have spotted the short comings of the Commodore manuals and have produced books teaching Basic and the inner workings of the computer. Many of these books are hardly any better than the Commodore manuals and you should purchase with care.

As a preliminary guide, I shall describe a number of packages covering different age-groups and prices.

Commodore offers a package for the VIC-20, C64, C-16 and Plus/4 called An Introduction to Basic. Whilst originally sold as a separate package, it has subsequently been offered in the various Starter Packs. You may be able to locate it separately if you look hard enough or contact Commodore.

The package comprises of two cassettes and a book. The manual is set out as a series of experiments which are linked to programs on tape. The material ranges from setting the computer up to fairly advanced programming. It was planned to see the frequent use of flow diagrams to demonstrate the operation of the programs. The approach is structured so that you must cover the early material before progressing through the manual. Overall it's quite a reasonable system which does its job well enough.

For the younger user, Collins offers a book entitled DATA LOGIC. This is a work book which has the appeal of a simple approach. Each page gently leads the user through the maze of programming, syntax and sound. The entire book is written in the form of a space ship's log with each entry or exercise adding to the presents. For example using screen printing and tabulation for the paragon for it... THIN for ticket design and using a spiral to design the captain's badge. The material is not covered in great depth but the book gives a good introduction to the use of Basic. At £1.95 it's also good value for money.

Glencoe Publishers have a wide range of teaching books and book/software packages available for a number of Commodore machines. Originally starting with the Dr Watson series of books for Basic and machine code, Glencoe moved on to the Watson's Note series for the C64. This is a six book series which deals with most facets of the C64.

The early volumes cover programming in Basic moving on to graphics in the later parts. The layout of the material is clear and tidy and is handled in a logical manner. If I do have a complaint it is that the content of the books is perhaps a little thin. At £1.95 per volume, I would have expected a little more depth. Nonetheless regarding this drawback, the series is well worth a close look.

Another good quality product from Glencoe is Basic Adventure Part 1. This book/software package teaches the rudiments of Basic to the seven to 13 age group. The book takes the form of a science fiction story involving Dr Watson. Programming concepts are introduced in small sections which compliment the text. Overall a novel and effective way of commencing teaching programming.

Commodore 64 Basic from Wiley is a really introduction to Basic. This is part of a Self Teaching guide series and uses self checking and exercises to aid you. The material covered is much as expected covering all facets of Basic, graphics and sound. Howevers are used extensively helping the pupil to develop a logical approach to programming. The book is sufficiently comprehensive that even once you have mastered programming in Basic, there are more advanced areas included at. This is exemplified by the section on databases and file storage on disk and cassette. The author is clearly American and this does unfortunately become apparent in the text with the introduction of some American colloquialisms. Provided you can stand the lingo in style, it's book is pretty good value albeit a little pricey.

For C-16 owners, Steve offers the Gateway to Programming series. This quartet of books tackles the subject in a similar manner to the Dr Watson series by using Sherlock Holmes stories to illustrate ideas. The text is humorous with lots of cartoon illustrations. In spite of the £4.95 price per volume, these are good value for money and worth a look.

Drawing Education produces a Commodore 64 Starter Pack consisting of books and two of their Screen shots books and a typing tutor cassette. The screen shots are full colour pictures of things as they appear on the monitor and illustrations of the results you can expect from the program. The books step gently through learning Basic and the cassette should help you to get to grips with the keyboard. The boxed set costs £11.95 but if the price is off-putting each book in the set can be bought separately.

All of the books described here have the virtue of using a well thought out approach to teaching Basic. In addition they are cheap and almost within pocket money range.

INTERRUPTS

UK Gibson introduces

C64 users to IRQ

interrupts.

What is Multi-Tasking?

THIS TERM IS USED TO DESCRIBE a computer that can run more than one program at any given time, each program being transparent to the other. Output to the video monitor or TV screen is usually split so that windows are formed, each window being a miniature version of the normal screen for each program. This system of running programs concurrently can either be produced by hardware or software.

In the examples we are going to consider there are no windows and the ability to run two programs is derived purely from software.

Unfortunately this operation can only be performed in machine code, but don't despair, Basic programmers, the steps to have two programs up and running simultaneously are relatively simple and will be dealt with in as simple and concise a manner as possible.

How it Works

The way in which we make a program run apparently transparent to anything that might be running is by making use of the system's IRQ INTERRUPT, this interrupt is called 60 times every second (or once every fifty).

When an IRQ occurs your C64 does whatever it is doing, whether it's a Basic or a machine code program and goes off to carry out its own little machine code program. Remember, this happens so fast that it is transparent to the system. The machine code, executed during an IRQ, is simply a housekeeping routine and does things like SCAN THE KEYBOARD, UPDATE THE SYSTEM CLOCK, etc.

When an IRQ occurs your C64 must know where to find this block of housekeeping code. It finds an answer from memory locations 788 and 789 (HEX \$054 & \$55). The two numbers stored in these addresses form the INDIRCT starting address of the housekeeping code.

You may have noticed something funny. Memory locations 788 and 789 are situated in RAM and that means that the information stored there can be changed at will, to be sure the processor tells the computer to go and do the housekeeping we redirect it to do whatever we want it to do first. As you now know, IRQ occurs 60 times every second so we now have a program that runs 60 times every second irrespective of whatever else your computer may be doing at the time. This forms the basis for running at least two programs concurrently. Now we shall go on to consider in more technical terms exactly how this process is achieved.

As stated earlier, memory addresses 788 and 789 contain the INDIRCT address for the start of the normal INTERRUPT CODE. Location 788 contains the low part of the INDIRCT ADDRESS and 789 forms the high part of the INDIRCT ADDRESS. This method of calculating INDIRCT ADDRESS55 goes for any INDIRCT ADDRESS55 used by your computer, ie: (LOW BYTE)*1600 + HIGH BYTE. Therefore, to find an actual address, we can use the formula:

$$\text{ADDR} = (\text{X}) * 1600 + (\text{Y}) * 256$$

Where X is the first location (LOW BYTE) and Y is the second location (HIGH BYTE), ie: 788 and 789.

Using this formula we can calculate the actual address of the standard INTERRUPT CODE with:

$$\text{ADDR} = (\text{PWR}788) * 1600 + (\text{PWR}789) * 256 \\ \text{PWREND}$$

This will give the start address as 59951 (\$B471). Write down this address as we need to jump to it at the end of our own custom routine, if this is not done the system will not scan the keyboard and the result will be a system crash. Therefore the last instruction in our code read be:

JMP \$B471

All of this will become quite clear later so do not worry if you're slightly confused at the moment. The programs given later are presented in such a way that they can be used by the novice computer owner, but will also form the basis of some more advanced INTER-

ruption in your program.

This code is fairly standard for setting up an interrupt driven software, although some programmers may wish to carry out some initialization before their program during this setting up procedure. The techniques for doing this will become apparent in later examples.

The routine as it stands will be situated in memory addresses \$9152 (\$15, \$C805), this is a 4K block of RAM situated above the Basic INTERPRETER. This is a convenient place away from the ranges of Basic, but almost any RAM location may be used providing you don't clash with Basic or the SYSTEM VARIABLES. Some

Address	Opcode	Operand	Comments
\$C800	SET		disable interrupts
			while setting up
\$C801	LDH	#520	set low byte of start
			address for code
\$C805	STA	\$0114	store it at 788 decimal
\$C806	LDH	#5C8	set high byte of start
			address for code
\$C808	STA	\$0115	store it at 789 decimal
\$C809	CLI		allow interrupts again
\$C80C	RTS		return to Basic
\$C80E	JMP	\$B471	example given later
			jump to standard
			interrupt code

RUPT DRIVEN CODE for the more experienced amongst you.

An example of this is to form windows using RAMDISK INTERRUPTS effectively splitting the screen using one half for one program and the second half for your interrupt code, unfortunately this is beyond the scope of this article.

How to Set up Interrupts

An ASSEMBLY LANGUAGE program to set INTERRUPTS would go as follows:

W300 is where your code begins and JMP\$B471 is the last

used locations are given below, although this list is by no means complete.

\$C800(\$152) to \$CFF(\$15F) - This is the space of RAM BLOCK, situated above the Basic INTERPRETER. As it is split from the normal Basic RAM (\$040-\$B000) it cannot be affected by Basic, therefore this is an ideal place for our INTERRUPT DRIVEN CODE. Basic RAM \$000(\$00) to \$000(\$00). Code can be placed at the top of Basic RAM but unless it is protected it will be overwritten by Basic STRING VARIABLES. To protect this area we must lower the top of Basic and also lower the bottom of STRING STORAGE. The pointers to

these are stored at 50-56 for TOP OF BASIC and 51-52 for BOTTOM OF STRINGS STORAGE. To protect 256 BYTES for our interrupt code we would use the program line:

```
10 POKE$1,PIB($2)-1:POKE
  $,PIB($2)-1
```

To increase this to 512 BYTES of protected area we would substitute -2 for -1 in the above program line and to cut to for each 256 BYTES required.

Line 10 as it stands will give us 256 protected BYTES from location 40704 (\$9F03) to 40958 (\$9F0E) for our code.

Cassette Buffer 628-629: This is the cassette buffer and is totally safe for disk users but anything written there will be overwritten by cassette LOAD and SAVE operations, therefore cassette users must be very careful when placing code in this area.

From the above examples it can be seen that the nearest and most convenient addresses to place code are from \$9110 (\$C000) onwards, therefore all the examples given will use these addresses.

Making It Work

Each example that follows will be preceded by a description of the program and will outline its purpose, this will then be followed by a Basic program containing the necessary code to data statements (this will also cover without a machine-code monitor to enter and run the programs given). Next will be given an assembly listing for those programs you wish machine code monitors and finally each example will be annotated to show you how to work.

Fuzzy Border

The following program is the shortest example that I could think of. Although it doesn't really serve any practical purpose it does give dramatic example of how INTERRUPT DRIVEN CGRN works. When this program is complete you will see no difference to the 44 screen but the exterior border will be flicking dramatically, and will continue to do so even while you enter or load and run other programs.

Note that all these examples can be switched off by using the CTRL+STOP and RETURN keys together.

Basic Program 1

This is a complete Basic program and will automatically load the code when run. Type it in exactly as shown, save it for security purposes and then run it as below!

Disassembled Listing 1 (with machine code monitor)

\$C000	901	disable interrupts
\$C001	UDA #500	load acc with low byte of indirect address
\$C005	STA \$0014	store it in low byte of IRQ RAM vector
\$C006	UDA #500	load acc with high byte of indirect address
\$C008	STA \$0015	store it in high byte of IRQ RAM vector
\$C008	CLI	enable interrupts again
\$C00C	RTS	return to Basic
\$C020	LDR #600	set counter for screen colours
\$C022	STZ \$0810	store it in border colour address
\$C026	DEX	decrement colour counter (ie change the colour)
\$C028	BEQ \$C027	is it done 255 times
\$C028	JMP \$A111	if yes then jump to standard IRQ code before returning

PROGRAM BASIC PROGRAM 1

```
1 REM BASIC PROGRAM 1
20 FOR A=0 TO 15:GOTO 40
  :POKE 40952+A,60:GOTO 20
30 FOR A=0 TO 15:GOTO 40
  :POKE 40954+A,60:GOTO 30
40 SW 40:32
40 SW 120,140,160,180,200,
  220,190,210,230,250,260,
  280,290,310,330,350,360,
  380,390,410,430,450,470,490,510
40 PRINT "END NOW ACTIVE!"
  "
```

If you have machine code monitors then enter the above code as shown, again you must always SAVE code before monitoring it, this cannot be stressed enough. Switch your set off and then on again, type LOAD "Fuzzy Border CGRN.MAN",1,1 and hit RETURN. Once the code has completed loading type SW 4952 to activate the code.

If you try to enter Basic code once a machine code program has loaded the chances are you will get an "OUT OF MEMORY" error. There is a Basic BEEP program at the end of this article that will overcome this problem.

Hopefully you have now entered and fully understood Program 1, if this is not the case then I would strongly recommend that you go back and read the preceding paragraphs, which should by

try to fit it yourself, or pay a dealer to fit it at extra cost, or I use this routine!

To use the program F1 blanks the screen and F1 opens it up again, therefore to load a program use the following procedure:

- 1 Type LOAD "YOUR PROG".
- 2 Press F1 and HIT RETURN.
- 3 Once the red "disk in use" light has extinguished press F1

It's as simple as that!

By the way a more exotic way of overcoming the problem is to blank and open the screen automatically using the RAM LOAD and SAVE vectors, but again that is beyond the scope of this article, sorry.

Basic Program 2

Remember to save program 2 before you execute it!

Once you have saved this program for getting it back in the computer and up and running are exactly the same as that for PROGRAM 1.

If you're still with us and have at least partly understood the procedure involved for the programs above, then you should by now be starting to realise some of the weird and wonderful things that can be achieved with Interrupt Driven Code.

We now come to our final program concerning interrupts and as you would expect it is also the most complex we have dealt with to date.

Defined Function Keys

This program gives us defined function keys, the keys are defined as follows:

- F1-Change border colour. This will step through each of the 15 possible colours individually.
- F2-Change screen colour. This will step through each of the 15 possible screen colours individually.
- F3-Repeat keys toggle. This will toggle between all keys repeat and cursor keys only repeat.
- F4-Processor pause. This allows Basic programs to be stopped in mid run and allows for map de-bugging and also a timer frame facility. It also works with program listings to allow easier reading. Please note this should also work with most

now hold a lot more meaning. That introductory program wasn't too difficult was it, we'll move on to some more practical routines now, so sit down and prepare yourself to enter a fascinating sphere of computer programming.

Using a Vic 1540 Disk Unit on the C64

If you've seen that bargain second-hand Vic 1540 Disk Drive and had to pass it up because you thought you couldn't use it on your C64 then this routine is for you. The 1540 disk drive will operate exactly the same as the 1541 when connected to a 64 apart from one major problem, it won't load programs without you first blanking out the screen and then opening it up again when loading is complete. This is a real nuisance and there are in fact two ways of overcoming this problem.

- 1 Buy a new 1541 ROM chip from Commodore for £18 and

no programs providing: They don't allow the interrupt vector, they don't occupy memory from \$C000 to approx \$C098, they don't disable interrupts.

This is by no means the most complex task that can be handled by interrupts but that's all for now, maybe some other time editor people!

Basic Program 3 (including initialisation)

Always remember to use

routines before running them as a crash can be fatal. To activate the above program, just LOAD the ROM file into \$549951.

Disassembled Listings 2

```

$C000  SET          DISABLE

190			49188 8478 76, 234

Please remember all of the above programs, especially the final one were not written with either speed or memory usage as their main criteria, but above all they were to be simple and concise making legibility easier. There are always various ways to solve most programming problems and the ones given were not necessarily the best solutions.

All of the assembly listings above produced on a Supra II's Mikro assembler cartridge on the C16. Some assemblers may

use slightly different assembler command codes. Conversion to these assemblers should be little or no problem due to the fact that the assembly listings are fully annotated. Of course should you have the Mikro cartridge you should have no problems at all.

Assembler Listing Loader Programs

As was mentioned earlier, if the assembled versions of

programs in this article are loaded using

```
LOAD("PROGRAM NAME"),L1
```

There are attempts to load a Basic program will fail and give the error G117 OF MEM42481. The best way to overcome this is by way of a small program called a BASIC PROGRAMMER as an example of which is now given below:

Tape Boot Program

```

10 IF A THEN 30
20 AA=B:LOAD("INTERLUPT
PROGRAM") L1
30 SYS 49152:NEW JOB SEE
NOTE BELOW)

```

Disk Boot Program

```

10 IF A THEN 100
20 AA=B:LOAD("INTERLUPT
PROGRAM") L1
30 SYS 49152:NEW JOB SEE
NOTE BELOW)

```

PROGRAM:	NEW BOOT
1	NEW *****
2	*****
3	NEW 49152:L1:ADDRESS 180
4	100:111
5	NEW *****
6	*****
10	FOR 0 TO 10:FOR 0 TO 10:1
11	PRINT 100,1
12	IF 0 THEN SYS 49152
20	PRINT "CLEAN"
30	ENTER "PROGRAM"
40	INPUT 100
50	PRINT "PROGRAM ADDRESS FOR LOAD ADDRESS 0"
60	PRINT "PROGRAM WILL AUTOMATICALLY LOAD COMPLETE "
100	BEEP 1,0,1,10
110	BE 100,100
120	BE 100,100
130	FOR 400 TO 6000:FOR 0
140	TO 10:FOR 0
150	FOR 0
160	PRINT "*****"
170	FOR 0
180	FOR 0
190	FOR 0
200	IF 100 THEN 50+0:RETURN
210	END:GOTO 1
220	RETURN

Note

Instead of NEW which will wipe out the Basic loader and leave the Interrupt Code running, a Basic program (your Basic Program) could continue from here of which the Interrupt Program forms an integral part.

Any of the programs that is loaded with L1 at the end (this is called a Relocated Load) will work using the above list programs. Remember the value for the SYS command may have to be altered to accommodate different code entry points.

A Little Utility

The program listed below is entirely in Basic and provides a useful facility. Should you ever come across a machine code program, whether it's one you have written yourself and have forgotten the SYS entry point or one written by somebody else, then this is for you. It can be LOADED using the L1 for the L1 entry but how do you know where it resides in memory and what value do you use with the SYS command to activate it? Worry not, this program automatically loads and locates almost any machine code program. The only programs will not activate are ones where the code entry point is not at the actual beginning of the machine code program. Although it will still tell you where the program resides so you can use a Monitor to find that out for yourself. Try it out on the programs contained in this article, they will all work. The utility is listed below and is called General BASICtag.

The Program

We have now reached the end of this article, hopefully with a better understanding of how our computer works, particularly IRQ interrupts.

If you have found this article interesting or have any problems and you own a monitor then please drop me a line on:

COMPUNET-84081,

L.A.R.C.A.D.I.A.

ANCIPITAL

Flippo flips over Ancipital and gets hammered at chess.

YOU KNOW WHAT? IT'S BEEN A HELL OF a month. I topped my high score on Ancipital (shock!) It's a good game, actually, finally found a good chess game that doesn't leave the pants off me, and not only that I've got a stack of Flippo's tips that'll knock yer eyes off!

*Clip it and See

OK, here goes. Ancipital is not really a new game, I admit that. But it's certainly one of Jeff's. Mine's best. I got a bit tired of most of his other stuff, the early one's just shooty ups are fine for a few moments, but quickly pall in the end. The experimental Mama Mama makes my head hurt, and I find it more than a little bit irritating. Having a Killtrod rammering all over the screen totally out of conscious control. (Purge you should use the Hammer — lol) Very fataly!

When was it Oh, yeh. Ancipital, or just plain 'Gippy to allinimadok, is a true original. Fear way gravity, a really off the wall objective, and a good blast on (all) alternative Universe. I like that. I think games which have a background story are more fun to play. You know, a little something to read before you power up the game, to get you into the feel of the story. That's where the sword very highly in my estimations, and that's in the little sci-fi book you get with the package. Come on, software house! You're here to entertain us, so how about it?

What's that? What's my hi-score on 'Gippy? Nah, I'm too modest. Nah! Centalaw? Aw, alright. If you must know, it was 368,888. Pretty good, huh?

Chess Mate

I must tell you about this... Look, I'm not really known for being a chess player. Well, actually, I'm rubbish, but I do keep playing it, despite humiliating defeats to

man and machine alike. I dunno, it's akin to the fatal fascination some folk have with cat scratches. The best chess game I've stumbled over recently, in my gluttony for software is Colossal Chess 2.0. It's so easy to play; simply moving your pieces using the cursor, rather than the old long-winded KPS-484 kind of input, you have to suffer in others I could mention. It's a delightful game, bringing back some of the peace and quiet of the real game. I beat the pants off me every time!

Hint Me Daddio! (Right to the Bar)

Here are a few tips for your waterpud. Stop me if you've heard any of these before.

(I get stilly; This game drives me bonkers! I thought I'd won the last of this so big incentive, but alas no! the game is back with new rooms, new challenges, and now a PDS! In sight! Blast! I just can't leave it alone though. Spin up the rope in the Cold Mine and you get into the Server System, goah! Go all the way up the back stairs to Norman Lane (Tap Off Plane), slip across to On the Road, Up On The Barometer, and finally the Main Perforo A Quikshifing (OK, Matthew looks, it now you read Hurry Fresh! Boaties Cornio! Climb up the rope and you'll find yourself in the Watertower. Get to the top, jump up, and you'll find yourself in the Rocket Room. Grab the gems at the top of the Rocket, and off you go, you're in the Space Station. Once on the Station, lead your way to the Transporter, and you'll

find yet another new system of rooms. There's also a great appearance of a room from Mario's Mansion... good game!

Backroads Road - Boulderdash II: On the first screen you have to blast a hole through a wall by dropping a rock on a fastly. Then you must clear the earth under a wall, and then drop rocks onto it. The wall is Magic, and it will create gems for every rock that passes through it. General tip: The asteroids will create gems if they are contained by rocks. Try watching gems from the side of piles of rocks and examine the way the rocks fall. There's an interesting clue on how to get seemingly enclosed gems out by utilizing creative stacking. (Sounds painful, but never mind!)

Made from Backroad next time.

Raves from the Fax File

My current favourite games are Ancipital (planasoft), for reasons previously specified; Bounty Bob Strikes Back (LJ Gold) still my bestie platform game, beating the pants off Walk, any day; Summer Games II (Eyes/CBM) if only for the fencing and the Archery; Remove on Fractal (Lucalite/Activision) one of the most state of the art arcade games in existence, and if Jeff endores it, then so do I! Ball Blazer (Lucalite) probably the most boring 3D game out, fast and furious; Super and the Topknocks Pans (Quikshifing Ashbit) the worst! And finally, Rock'n'Roll (Activision), to me mind the only new game from these boys worth a light.

That's Yer Lot!

OK, that's all in the bags of fellow Prindle Walks a Long Way Off and Conquers His Fear of Strange Fruit... we have time for this month. Next time world... well actually you'd better wait and see. You'll always spill the beans, and what thanks do I get! None. So off you go and write me a letter about your high scores. Go on! And don't turn to the next page until you're done it! Hurunght!

Stuart Cooke goes bonkers
about Grendin Graphics
Boulder.

GAME

of the month

EVERY ONCE IN A WHILE A GAME arrives that you put in your disk drive, play for five minutes, think it isn't very good and put it away. Five minutes later you'll stick it back in the cassette recorder and suddenly find that it's three o'clock in the morning and you've been playing the game for hours. Well, Boulder is one of those games.

Remember the game that you used to play when you were kids (or maybe you still do) where you can't step on any of the lines around the flagstones or the monster will get you? Well, Boulder certainly owns a little of its background to this.

You play the part of a bouncing tennis ball travelling across a scrolling path. Your way is hindered by a large number of pitfalls. Perhaps the main problem that you have to overcome is the fact that you can only land on the paving stones. If you miss there your tennis ball plummets to the ground a long way below you. I'm not quite sure why the path is floating above ground, but you can't knock the programmer for a lack of artistic licence.

Large gaps in the paving can be bounced across by means of the super

bouncers. These are paving stones which have an arrow on them and give your ball that extra power it needs to bridge the gap.

Large walls block your path so you must guide your ball around them. In the meantime you can hanglers and floating logs are trying to stop your progress.

If (or when) you manage to reach the end of a level you'll find the goal awaiting your ball. If you enter this then you'll find your score increasing.

After each level you'll find yourself entering the bonus screen. This consists of a number of paving stones with question marks. Landing on a question mark increases your score. Be warned you only have a limited number of jumps in which to increase your score. Excessively leaping here is certainly bumps up your points.

Scattered around each of the levels you will find a number of mystery paving stones. These have the same mark as those on the bonus level but will not always give you more points. If you are lucky then you will gain extra jumps for use on the bonus level, extra points or extra balls. If however you are unlucky you will find

your ball being changed to death by a mouth or eyes punctured by a flying dart.

The hazards become more severe the further you get into the game. Missiles are launched from the sea, man (ball?) traps suddenly appear and burst your ball, a plethora of flying bonuses get in your way, even some of the paving stones disappear from beneath you. In fact it seems that everything is out to prevent you from reaching the goal and bonus level.

A superb tune sets the atmosphere for your travels along the pathway. The graphics are excellent and your ball spins as though it has just left a tennis star's racket.

As a bonus an extra game, Metalbolic is being given away free with Boulder. Metalbolic is a conversion of an earlier Spectrum game and offers very little difference from the original.

You play the part of a little bird who is flying around a vast number of locations attempting to stay away from the numerous hawks. Your aim in life is to collect a number of radioactive pieces scattered around in some extremely inconvenient places.

Mapping the locations for this game is definitely a must as you will soon find yourself lost.

Metalbolic offers nothing out of the ordinary and probably wouldn't do too well as a stand alone game. However being included in a package with Boulder makes it an excellent purchase.

Boulder is definitely one of those 'just another £10' type of games and a must for any serious Commodore 64 collection. Especially when you remember that you are getting another game thrown in for the price of one.

OR... MADE BY ALIEN

THE FINAL CARTRIDGE®

THE FIRST OUTSIDE OPERATING SYSTEM FOR THE CBM 64

This new operating system built in a cartridge does not use any memory and is always there. Compatible with 99% of all programs.

Features:

• **DESK TURRET** - 4 times faster disk access, loading and saving.

• **SAFE PURSUE** - 50 times faster, even with files - normal Commodore commands - compatible with standard disks.

• **ADVANCED GRAPHICS INTER-FACE** - compatible with all the well-known commercial printers and Commodore disk printer programs. Prints all the Commodore graphics and control codes (important for listings).

Advanced screen dump facilities (Prints Low Res, Hi-Res and Multires, four - Fullpage/Full Line fonts gamma and color programs, the Doodle, Koolha, Pal etc. Besides compatibility for the memory address of the palette.

• **TWO DEFS ROM FOR BASIC PROGRAMS AVAILABLE** Two memory banks, "Memory read", "Memory set". They store 100 bytes with readable/writable speed, available in the 64K Ram of the CBM 64. Can be used with strings and variables.

• **SAVE & COMMANDS** - 100 Speed, Drive, Dappone, Catalog, etc.

• **BASIC TOOLKIT** - with Auto, Format, List, Copy and Delete, Find, Help, Del, etc.

• **REPROGRAMMED FUNCTION KEYS** - Run, Load, Save, Catalog, Disk commands, List, printers all for protection.

• **KEYBOARD EXTRA'S** - Allows you to delete part of a file, stop and continue listings, reset cursor to lower left-hand corner, Home and Beyond in files. Top commercial operates your printer as a typewriter.

• **COMFORTABLE EXTENDED MODE SCREEN** - with coloured font scrolling speed-down, Bank-switching, etc.

• **RESET SWITCH** - resets to standard, resets with on, resets to 45-Res printing, resets every protected program.

• **ON-OFF SWITCH** - we hope you never need this one.

15 Months triple warranty guarantee...

14 Days money back guarantee if you are dissatisfied.

Part two of Daryl

Bowers' machine code arcade game.

IN THIS MONTH'S ARTICLE I am introducing the multi-purpose interrupt handling routine and the end of the routine 'INT'. We have also got some smooth scrolling and wrap-around! Can you hear the anticipation?

If you look at the source code being you will see that \$01FC0011, \$15C0013 and \$148002F need to be changed, and lines \$5402d and \$550 must be replaced with blank remark lines. Move on to heavy stuff!

The first 40 lines are an addition to 'INT'. The section to set up interrupts is the one with which we are mainly concerned. First, we disable interrupts with ME. If we did not, and an interrupt occurred while we were changing the interrupt vector, the CPU could probably crash.

Locations \$0114 and \$0115 hold the two byte address of the interrupt handling routine. This normally points to 'MAB' - where the 'EIRNAI' takes care of the keyboard input and various other 'events'. We shall replace this with the address of our own routine - 'HANDLE'. This is done in lines \$000 to \$53d.

Next we enable raster interrupts - in other words, when the raster in the monitor reaches a certain point down the screen an interrupt will occur - lines \$540 to \$560.

Locations \$0071 and \$0072 hold the 'raster compare value'. If we place a value in these locations it is stored by the Vix chip. When the raster reaches that number of lines down the screen the Vix chip will cause an interrupt. \$0072 contains the low byte and bit zero of \$0071 contains the high bits of this value. We set up the value of the first interrupt position in lines \$570 - \$610 to \$000.

Having changed all this we can now enable interrupts again - 'CLR' - and finally we shall turn off the keyboard - lines \$620-\$650. We do this because the depression of a key causes an interrupt when we don't want one - by scrolling

GGY

these lines, and see what happens!

Lines 890 to 970 reduce the number of columns of characters on the screen to 45, by blanking out the first and last. This means that characters will smoothly scroll off the edges of the screen, again, by coming there and watch the left hand side.

The end of this routine simply places the data in lines 870 and 890 on to the screen, from the 'AND' statements. These are used because the assembler converts alpha-numerics in BYTE statements into their ASCII values. The C64 screen, however, uses values of less than the ASCII equivalent. These 'AND's, therefore, remove bits seven and six from the values - the equivalent of '64'.

Handling Interrupts

The routine 'HANDLE', is designed to be totally portable, that is, you can use it in any program. Five tables are used: 4940 SCROLL1 - this contains the 1 smooth scroll value; 4950 RAST2 - the Y positions where raster interrupts occur; 4960 BORD1 - the border colour;

4970 BACCT - the background colour;

1480 INBARCV - the address of the scroll routine.

I have allowed six interrupt positions - you can add more or use less - and it is easily possible to add more tables defining further effects; Y smooth scroll for instance.

Now we know that if any interrupt occurs the processor will complete what it is doing and jump to 'HANDLE'. The first thing we must decide is whether the interrupt has been caused by our raster compare value or by some other source. This is done in lines 890 to 958. When a raster interrupt occurs, bit zero of \$D019 is set to one. If this is not set we jump to \$A431 - the normal KERNAL routine. A 1 must be written back into \$D019 to clear the register, ready for the next interrupt (a rather strange way to do it if you ask me!) in line 960.

The next dozen lines check the value in \$D012 (the raster raster position) against our table of values, and branches to

the appropriate POSITION.
At this point the value of X is set up ready to index into the tables.

The routine ANYPGR is used for all positions, and sets up the X scratch scroll, next interrupt position, background

and border colours and the address of the movement routine. The effect of this is to allow 'bands' of characters on the screen to scroll at different speeds, in different directions and with different colours. No mean feat!

'TINNT' simply restores the registers to their correct values and returns from the interrupt.

The Scroll Routines

Essentially, all the scroll routines from line 4628 to 5240 are the same, so I will concentrate on just one of them: 'MOVNT'.

The 'band' in any line like 4628 will be moving from right to left at a rate of two pixels every interrupt (200th of a second). This is achieved in lines 4708 to 4880. If it were to move right we would INCREMENT the value in SCROLL+Y.

Next we check to see if we have scrolled a whole character - lines 4888 and 4928. If the value has reached minus one we replace it with seven (lines 4938 and 4948) and proceed to scroll the characters eight pixels (one character) to the left - lines 4950 to 4958.

'SCANDELT' is the routine which fills in the right-most character, in this case with the character which 'falls' off the left.

It will be seen that 'ANYPGR' and 'P8180G' have now been moved to the interrupt routine. This is to ensure that there is no flicker when the sprites are moved, since they are printed when the raster is below them.

There's More

When typing in the listing, change the symbols 'A' and 'F' to 'a' and 'f' for example:

```
LDX # 8040D & 201 becomes
LDX # 8040d
```

This is because my assembler insists on being 'backward' when it does a listing! 'START' should now be at location 5215 (913), 'TINNT' should now be at location 5235 (933).

Next month we shall introduce the frog movement routines, and a joystick reading routine.

THE • BEAT • GOES • ON •

Syntron's Digidrum is fast-tapping, hard-clapping good, according to Eric Doyle.

THE HEART OF A GOOD BAND IS THE ability of the rhythm section to mark time with the accuracy of a metronome and the wit and verve of that venerable hip technology has developed the rhythm generator as the ultimate musical timepiece. The problem is that, unless you are willing to pay a small fortune, the current generation of machines has as much soul as the ticking of a clock. But this appears to be changing.

Syntron's Digidrum is a flexible drumkit synthesizer which allows for those little touches of individuality which normally differentiate the human from the machine. There is sufficient programming flexibility to allow changes in rhythm and variation in style and to convince the average listener that he is listening to a syndrum kit played by a human.

The Digidrum package consists of a set of disks, containing the computer software and instrument databases, and a cartridge which plugs into the user part of the C-M. The cartridge has a standard jack output for connection to an external amplifier and a trigger output which can be used to keep several slave sequenced synthesizers in time to the beat.

On loading the software, you already have a standard drum kit of seven instruments: base drum, snaredrum, three tom toms (bajo, small and floor), a crash cymbal and a hi-hat. These give a range of eight sounds in all because the hi-hat cymbal are classed as two separate instruments whether open-or-closed. The sample programs give an opportunity to hear how the drumkit sounds and very impressive it is too, despite the slightly electronic sound.

The computer program is in two sections. The first part allows you to compose short drum patterns and the second permits you to combine these patterns into complete backing tracks. There is no facility for printing out either the patterns or the songs so I found the best method was to switch from one section to the next and assemble the song from such patterns whilst the sound was fresh in my mind.

The pattern composer will permit 21 different patterns with a length of 38 beats. This is an arbitrary figure because the tempo can be changed over 64 steps which gives a range from the very, very slow to the impossibly fast. The instructions suggest that the mean value is around 44. The screen display looks like a familiar musical staff but there are eight lines instead of the normal five, each with a letter corresponding to one of the instruments.

Notes are entered by moving the arrow cursor along a translated vertical scale at the bottom of the screen until the correct position is reached. Then the letter key corresponding to the chosen instrument is pressed. The result is that a symbol appears on the relevant line and the instrument is heard. After a few notes have been entered, you can listen to the pattern singly by pressing a function key.

The number of instruments which can be sounded at the same beat position is limited to three. A drummer only has two hands so the program makes it impossible for a snaredrum, tom tom and cymbal to be sounded at the same time but a snaredrum, cymbal and bass drum can. The flexibility of this system means that a respectable and plausible drum solo can be created using trios, congas/casaca or any other device or basic rhythm which takes your fancy.

Each pattern does not have to be a full 38 beats long it can be terminated by placing an end bar at any position along its length.

Once a few patterns have been created they can be combined into a song using the second program. This is extremely simple to understand. The screen shows several columns which are totalized in rows from one to 100. This is the maximum number of steps which a song can have (but since each step can consist of the same pattern repeated 100 times it doesn't take an lifetime to work out that there is room enough for even the most ambitious project).

Entry of a song is made by selecting the pattern number and the number of repeats which are then displayed on the song screen. The song can then be played in full or part to see how it sounds and if necessary a pattern can be called up and trimmed until the fusion is complete.

As in a word processor, there are several keys which allow the selection of blocks of the song which can be copied, deleted or inserted. Similarly patterns can be copied from one pattern position to another so that small changes can be made to create a new variation to add interest to the generated rhythm.

There is room for 30 songs which use the same bank of patterns and these can be saved in disk for recall when necessary.

In addition to the basic drum kit there is the option to replace any or all of the instruments with new ones which range from the hi-tech syndrum sounds to the more unusual percussion instruments such as a wood bar or even a very realistic hand clap. The limitation is still eight sounds and only three to a beat.

In the studio it would be ideal for making demo tapes and the only complaint I have is the length of time taken to create the patterns. I did find this stage quite enjoyable, however, giving plenty of freedom to experiment. For live performance, Digidrum would only be practical if all the music used the same percussion set or the performance was organized to allow time for loading.

Although there are limitations to live performances, I am quite sure that it won't be long before the strains of Sid Syntron's exhilarating syncopation are heard in the local pub.

Ian Waugh has been
discovering Island Logic's *The
Music System*.

THERE ARE ALREADY DOZENS OF music packages available for the C64, all with their various strengths and weaknesses. Anyone who launches yet another package must think they have something pretty special.

If, in your early turn of life at the mere mention of a BBC Computer, you may well have heard about Island Logic's *The Music System* which was hailed by music-minded users as the best thing since memory expansion boards. The development team, System Software, has now produced a version of *The Music System* for the C64 and 128 and distribution has switched to Finland.

As you might expect, the superiority of the MD chip immediately gives any Commodore music program a tremendous advantage over a similar one on the Beeb. Not content with this, System Software has included a MIDI module which allows access to external synthesizers.

The Music System (or TMS as it is usually referred to) was highly regarded not only for its music features but also for its use of icons and pull-down menus. The Commodore version can only enhance System's programming and design reputation as its use of these features are not only superbly implemented but they also make its operation relatively simple. And with its modules to choose from and over a hundred functions available from the keyboard, it needs to be simple. Most keys perform the same functions in each module so it's nowhere as near so daunting a task as it may at first appear. A handy Quick Key Guide helps enormously and you'll find after a little use that the keys fall under your fingers quite naturally.

Right let's take a look at the modules. There are the Editor, Keyboard, Synthesizer, MIDI, Printer and Linker whose icons are displayed on the main menu screen. Each module has a Command Line running across the top of the screen from which the pull-down windows...er...pull down. There are four menu items: Files, Values, Commands and Info and each is selected by pressing one of the function keys. The information given in the Command Line menu differs from module to module but is similar in type.

Files controls the loading, saving, renaming and deletion of files and only those relevant to the module you are in can be accessed from that module. Values holds such information as key signature, tempo, octave, volume and voice

number. Commands is generally concerned with instructions which affect the whole or large portions of the piece such as delete track and clear all tracks. It is also home for a set of macro commands such as setting markers, copying sections to the notepad (more of that in a moment), adjusting beatlines, snapping and copying envelopes and filters, etc. Info displays general information about the state of your composition, for example note storage space and the names of current music and sound files.

Moving on to specific modules, the one you are likely to use the most is the Editor. This displays a treble and bass clef in what is referred to as the Voice Monitor (VMW). Notes are entered here. The VMW only shows one voice at a time but you can flip from one to another at the press of a key and the bars are always aligned.

Notes are moved up and down the staves to select pitch and the note name and octave is displayed in a small box on the top right of the screen. Each note can be assigned a different volume level and any one of 16 envelopes. The current bar number is shown and horizontal bars (called beatlines) indicate how much has been recorded on each voice. You can scroll through the score with one and notes can be inserted and deleted at any point. A full range of accidentals can be used including double sharps and flats for the musical intelligentsia and notes can be turned into triplets and tied although no

more than two notes can be tied together at once.

The program will insert bar lines automatically if required and you can insert first and second time bars. Another feature of TMS is the ability to define loop sections. When played as part of a tune, a loop section will keep repeating until the whole tune has finished. Each voice can contain up to 20 different loop sections so you can quickly select one of a number of repeating bass or rhythm patterns to improve over or for use in a tune.

If all these features leave your mouth watering and fingers itching it's only fair to warn you that we've only got to page 25 of the manual. There is lots more to come.

From the Commodore menu you can call up a set of macro commands. These operate upon a section of a voice which has previously been marked with two markers. Macro commands include transposition and envelope and volume assignment.

Yet another feature is the Notepad. This is used to store a section of a voice which can be moved to another part of the same voice or a different one. It can also be used to merge two music files together and notepad files can be saved and loaded like any other although only one can be held in memory at a time.

If you prefer to tap out tunes on the Commodore's keys, enter the Keyboard module. Real-time note entry from QUALITY keys is not the easiest way of writing a tune but the Keyboard module

N
O
W

HEAR

THIS

helps to make a difficult job as easy as it can be. Three voices are entered monophonically with horizontal banners to show you how much room is available for each voice and the VMM can be called to display the notes. The keyboard is entered in practice mode, or Talk as it is called in the manual. Music and sound files can be loaded although only music files can be saved from here. The manual is kind enough to explain that anything but simple notes may produce entity compositions - and it's right - but then the Editor module includes a Block Edit command to help put right the mess you make.

The Synthesizer module is where you come to grips with MD. It must be the most complete and sophisticated MD-chip editor yet devised. Graphic displays give a visual indication of MD's parameters and you can load and play a music file to hear the effect of the envelope as you alter it on a proper tune. The envelope includes waveform and filter selection and you can save each creation for easy reference.

The Synthesizer includes extra facilities like sweeping the pulse width, pitch and filter without using another voice - an extra bit of magic.

The MDI module will be attractive to a lot of users but let us not forget that a MIDI interface is also required. The program supports the IBM (175) and the Rosport (175) interfaces and although it may work with others this is not guaranteed. Although the concept of

MDI was to produce a standard set of digital information signals, the standards haven't yet filtered down to MIDI interface manufacturers.

This module is basically a six-track polyphonic real-time sequencer. It records most performance information but not pitch-bend which cuts off any following data. I wonder how this got past the debugging team. You can set the tempo, select and delete individual tracks and pause recording by pressing the space bar. There are no channel assignments or editing facilities but it is a rather excellent extra and TMS is not, after all, a dedicated MIDI program. A big plus is the ability to convert MIDI files to music files playable by MD and vice versa. Regrettable but rather obviously, any multi-part polyphonic pieces are converted into three monophonic lines. Performance data goes but voice numbers in the range one to 31 are converted to envelope numbers. You can use the MDI module for real-time input and take up the parts later in the Editor.

The Printer module supports Epson and Commodore printers and you can add lyrics to the score, too, providing a convenient copy of your masterpiece.

Finally, the Linker module is used to link individual music files. It is the only way tempo, key and time signature changes can be implemented in a single piece and, of course, it allows numerous compositions to play through in total. Up to 26 files can be loaded, memory

permitting, and arranged to play back in a sequence which can contain up to 99 notes. The whole arrangement can then be saved as one file for convenient reloading and playing although you can't play this back through the MDI module.

The 34 page manual is well-produced, well-written, easy to read, full of illustrations and a comprehensive index will lead you to virtually every occurrence of every aspect of TMS. Unlabeled demo tunes are supplied on the disk with even more on the other side is bit naughty, these reversible disks, aren't they?

You may have guessed by now, but if you haven't, here it is: TMS is the ultimate Commodore music editor for the MD chip. The MDI module is a bonus although musicians with serious MIDI requirements will need a dedicated software package. TMS is easy to use in spite of its wealth of features and it's fun. If you are at all interested in making music with your Commodore, I can not recommend it too highly.

The Advanced version of TMS containing all the modules described above retails for £29.95 and is available only on disk. A smaller version containing only the Editor, Keyboard and Synthesizer modules sells for £17.95 on disk and £14.95 on cassette. What will System produce for the Amiga?

The Music System is available from: Festival Software, Wellington House, Upper St Martin's Lane, London, WC2H 9DL.

Yak's Progress

Demarc: £11.99 4disk CD-ROM cassette CD4 - joystick

JEFF MINDER HAS BEEN around since Yak was just a lad and now a collection of Minder games is available under the title of Yak's Progress. As a document of one man's

fight to tame a machine, this companion is fascinating and allows the newer CD4-owners to catch up on some of the best and most unusual mapping games to be devised for the machine.

Eight games for the price of one is an offer that few will refuse and for many it will provide the chance to get turbo versions of games already in their collections as well as filling up any gaps.

Attack of the Mutant Carnies and Revenge are both here alongside Matrix, Laser Zone, Sheep in Space, Mutagenetic Llamas, Antigravit and Hover Berries.

There are enough games to give you the hump, sleep to drive you bananas. The graphics vary as Minder's programming skills develop and the accompanying booklet gives the lowdown on the workings of the programmer's fevered brain.

To try to describe the games would probably take most of the review space in this issue because the games are unlike anything to be seen elsewhere. Imaginative and demanding, they are not everyone's cup of tea but the Minder following is by no means a minority movement. **LD.**

The Last VII

Mastertronic Mad series £2.99 CD4

"WE RETURN TO BASE immediately" crackles the voice in your headset and you're off in a race against time as you try to get home before a delayed attack nuclear warhead wipes you off the face of the earth.

As a scientist working on project VII, you were hidden deep underground at the time of the holocaust. You have now been allowed to try and make contact with the survivors.

The screen is divided into two windows. The bottom depicts your instrument panel whilst the top gives a bird's-eye view of you and your surroundings. The data you have to watch here isn't simple—they include speed, distance to base and time before the explosion. You will, however, have to keep your eyes firmly on the road.

Providing you stay on the road, all well and good but you

soon discover that you cannot take corners at 400kph. One crash and that's it—game over.

If you slow down to take corners, there is no time for you to return to base before the bomb detonates. Ironically, I realised that some of the trees I kept hitting could, with slightly better driving, be avoided.

Strangely, the speech adds little to the game's atmosphere but the rest is extremely addictive. The car is very responsive and the music is great. You don't have to be a racing fan to enjoy this one. **GM.**

Blackwyche

Ultimate £9.95 CD4 - joystick

MUCH HAS ALREADY BEEN said about the CD4 answer to the Master Colours, the ball ship Blackwyche. In my opinion, a lot of this was pure hype. It is an adventure style game and has little to commend it over many similar offerings.

Starting on the upper decks you are immediately harried by winged demons and the occasional flying octopus! Unarmed and helpless, your first task is to examine the coffer to find a sword guarded by two nasty skeletons. Attacking from both sides, they beat you with bony fingers, knocking down your energy level as they do so. You must find antidotes to restore your power.

Once you have the sword you can attack the flying monsters outside but it is ineffective against most of the ghouls in the other cabs.

Occasionally you will get a surprise as you enter a cabin, the floor gives way and you end up dazed on a lower deck. Ladders lead up and in this way you can tour the whole ship making discoveries but no friends.

The locations are numerous but the graphics are very repetitive. Only colours differentiate which deck you are on. There is some suitably nautical music over the opening screen but during play there are only the sound effects which are fairly unimaginative. **LD.**

Dynamite Dan

Microcab £7.95 £14

5 7 7 8

ARRIVING BY ZEPPELIN at the hideout of Doctor Blitzen is not the safest approach. Dynamite Dan could have

made. With the assistance of his henchman, Donna, the doctor has set into operation a multitude of defence systems

and it is up to nimble-footed Dan to avoid these obstacles, steal the plans for the super psychotic mega-ray which Donna and Blitzen have secreted in the safe, and make his escape.

This is a new platform game from Microcab and it is definitely difficult. As you guide Dan around the house looking for the eight sticks of dynamite needed to blow the safe, all manner of creatures have to be avoided while keeping an eye on your energy level. Food is found at regular intervals which will boost both Dan's energy and your score depending on the type of food found.

There are other objects which score points, but the most valuable are the tool tables. The score for this discovery is a sizeable 25 points but they do give Dan an extra life which is absolutely essential for success.

At the bottom of the house is a timer and Dan displays what is quaintly referred to as 'negative buoyancy' - he can't swim. This is the most dangerous of all the game's elements because one dip in the water and all of Dan's lives are lost.

The game will challenge any platform fanatic with a yearning for explosive fun.

LD

Hero of the Golden Talamon

Mastertronic Mail Range £2.99 £34

6 4 4 5

MISSING MY FIRST JUMP in Golden Talamon, I was more than a little surprised to find myself wandering under

water being chased by a shoal of ferocious-looking piranha. As usual, I had not read the instructions, otherwise I would

have realised that a fair proportion of this arcade adventure is of a subaquatic nature.

In order to find the five pieces of the talisman, you must manipulate candles, keys, ropes and spells as you make your way through the various tunnels. Assorted monsters including particularly vicious fire-breathing dragons are intent on stopping you. You can carry up to five items at once, the left-hand box showing the one currently in use. Also shown on the screen is a stylised map of where you have been, indicators of your strength remaining, oxygen carried and a large map of

immediate surroundings. Your strength and oxygen supplies can be increased by collecting fruit and bags of air that appear periodically.

Movement is straightforward, the only tricky bit being the jumps which involve the dragons on the joystick. There is no scrolling between them so you are never sure what you will find on the next one. The graphics are large and blocky with some of the movement being jerky.

This game has some original ideas but they don't quite gel together and the overall impression is uninspiring.

GM

Fighting Warrior

Microcab Home £5.95 cassette £14.95 £14 £14

3 5 6 5

AS PRINCIPLES EVERYWHERE want to go, your hero has managed to go and get himself kidnapped and you set off to

rescue her. The setting is ancient Egypt and in order to achieve your quest, you have to battle against assorted

creatures such as humans with jackal heads and winged demons.

Both you and your opponent try to hack each other to bits with swords. The amount of damage you can sustain is depicted by a number of arrows at the bottom of the screen and a successful strike reduces this total by one. When it reaches zero, your adversary dies or you lose one of your five lives.

Combat itself gives you a choice of three aggressive and four defensive manoeuvres. You can aim a high, medium or low blow and can jump, duck

and move forwards and backwards. In practice, the battles tend to degenerate into a slogging match with both sides standing still and trading blows. After the combat, you get the chance to take a bribe at the magic vase that appears. This may increase or decrease your strength, take you to another zone or have a battle with a god.

Fighting Warrior lacks any lasting appeal. Every battle is much the same as the last and there is only a limited range of movements available.

There are better combat games on the market. GM

Journey

CBE £19.99 C4+ Amstrad

5 5 3 3

KEEP YOUR HANDS FREE AND hold on to the sides of the vertical shafts as you climb down, otherwise you could

come to a disastrous end. The adventures must collect 11 treasures from the centre of the earth and bring them to the

surface. Dragons, magnetic fields, dynamite, detonators etc. hinder your search for the treasures. The player can escape from the samurai by climbing up or down a shaft. There are guns which can be used to kill deadly samurai bats and oxygen pills which can be taken when you enter a gas chamber. To pick something up you must stand over it and push up on the joystick. If you get too heavy you can drop something by pushing down on the joystick.

This is yet another arcade strategy game of the Dungeons and Dragons ilk. The special effects show you something in your death

and those used in the transports are original and good. There are two speed levels, fast and normal. The documentation is adequate and full playing instructions can be found on the back of the cover. The player has three lives and starts each time at the surface. There are different levels of skill the first one being that of a beginner's trail.

At first I was continually having to start over again after something to my death. I found the trick is to hold on to the sides as you climb down. I recommend this challenging game to anyone who wants a few hours of fun.

J.L.

Thunderbirds

Fixed - Super Silver Range £1.95

8 8 9 5

A TEAM OF ARCHAEOLOGISTS have got themselves trapped in an Egyptian tomb. They send out a mayday distress signal which is picked up by International Rescue. Thunderbirds are go.

You control both Thunder-

birds 1 and 2 (the fire button toggles control between them) and you have to find your way through a maze of passageways inside the tomb. As in all the best mazes though, it contains a huge number of traps. These come in two forms - huge stones that block the passageways and guardians such as mummies and spiders that try to stop you.

The main problem is the blocks. These are of three types. TB1 can only move blue blocks, TB2 green blocks and both can shift yellow blocks. The maze has been very ingeniously designed and it requires considerable planning to get through. Frequently you

think you have solved a problem only to find that one of your walls is blocked in. To get to the correct position to shift certain blocks, one of the TBs is quite likely to have to detour through three or four other chambers first.

TB2 can carry certain equipment and a menu lets you choose what to take. These items may help you in a later stage of the game but you have to find out how and where. Fuel is a must.

Thunderbirds, although not graphically brilliant, is an excellent game which is guaranteed to keep your grey cells working over. FAB Vingt.

G.R.H.

Quest for the Holy Grail

Masterdisk £1.99 C4+

1 1 4 5

"MONTY PYTHON WITH chips" reads the title. This supposedly rocky adventure game should be served with

large dollops of green slime, bearing a striking resemblance to Scott Adams' original adventure games of yesteryear, this

game tries to improve on them by using graphics, but not to any success.

In Lappin is on a quest to find the Holy Grail. The game starts off in a large where the player meets a CMD man with a nuclear powered lamp and a key. He is able to go west, east, north, south, up or down. When Sir Lappin has been squashed by a falling tree or drowned by flying snail or has befriended some other (legally he retains his quest in the large again).

This value for money game offers the enthusiast on a tight budget many hours of

exaggerating fun and a large vocabulary of four letter words. The writers have left all clues, instructions and commands of how to play to the player (although not on previous experience. Using 'help' yields "Yes, you'll need it", "No, it's nothing" or just plain "No"). There are a few original results for some commands - try 'quit' for instance or use 'drop' and suffer the consequences once you are carrying the nuclear powered lamp! I found the language rude and/or silly, and do not recommend it to anyone who wants a challenging and exciting game to play. J.L.

School Daze Microsphere \$4.95 C64

CONVERSIONS FROM SPECTRUM to C64 often disappoint me but the plot of *School Daze* is so good that even the jolly scrolling action does not detract from the enjoyment.

life and death to seal your report before the Headmaster sees it.

The hero is called Eric, a good name for a hero if ever I heard one, and he must obtain the secret combination of the schoolmaster's safe if he is to save his reputation. If the boy's name does not appeal to you, the names of the main characters can be changed at the start of play.

Like all schoolboys, Eric has lessons to attend and if he is caught wandering about during lesson time, or missing about generally, he will be given lines by passing teachers. If he is clever he will make sure that someone else is closer to the teacher when misbehaving because the blame generally falls on the nearest boy. If Eric misses more than 10,000 lines he is immediately expelled and the game starts again.

To find the combination, Eric must jump up and hit all of the shields which are hanging on the walls around the school. Some of the shields are too high for a mere schoolboy to reach so violent measures are called for in desperate circumstances. This may involve knocking down a fellow pupil or a schoolmaster and using them to give the necessary height to reach the shield.

When all of the shields have been set in motion, Eric must knock down each teacher in

turn to reveal a single letter of the combination. Unfortunately, the dishevelled and filthy teacher can only remember (as if he sees his own date of birth written on the blackboard) three letters of the date during the game but if you guess wrong the nasty little devil of the class will split on you for writing on the board.

Once Eric knows the combination he must rearrange the letters into the correct order, he only knows that the headmaster's come first. The game is written on a clean blackboard and then he must rush to the staffroom, jump up in front of the safe but if it doesn't open he must go and guess again.

Reviews of the expansion disc run and the game because the shields need to be hit again to stop them flashing. With the use of a catapult can always help with hitting the shields but this does run the danger of getting lines.

The screen is a love of activity but it's a pity that more was not made of the C64's capabilities. A touch of blatant sexism creeps in with all of the characters being male but in the tradition of Tom Brown's Schooldays and Billy Bunter I shall overlook this and not put Microsphere in detention.

The old saw about these being the happiest days of your life is laid bare by this, the most traumatic game of your life.

Ed.

Willow Pattern Revised \$3.95

MOST PEOPLE WILL BE MORE design on them. The design stage have eaten a meal off plates with the willow pattern

game is an arcade adventure based on that story.

You play a mere clerk who is in love with a princess. The trouble is, she is promised to a merchant so you decide to break into her palace and rescue her. To do that, you must find your way through a maze, find certain objects, overcome the palace guards and then escape in a boat.

In order to defeat a guard, you must throw a record at him before he throws one at you. You can only carry one record at a time and so you will have to backtrack a lot (this award can be found by yourself or you can entice a guard to throw

one and then dodge out of the way).

Occasionally, you have to cross a bridge which you do by leaping from stepping stone to stone. It's not quite that easy as these giants try their hardest to knock you over and so being your legs becomes crucial.

The graphics in Willow Pattern are exquisite with pictures of Chinese temples, bridges and trees. My first impression on playing it was that it was a better Wolf book-like but the way that the game plays makes it totally different. At £3.95 it is excellent value for money.

G.R.H.

Space Hunter

Mastertronic £1.99 C64 + joystick

2 6 6 5

THE RED ALERT FLASHES AND you prepare to defend yourself against the waves of fighters that threaten to destroy you.

The inhabitants of Earth are starving and none of the space fleet pilots have returned from their mission in search of food.

As a last desperate attempt to save the Earth you, a Rookie pilot, have been sent to capture the food transporters before the aliens.

The position of the target ship, which can be changed by the player, is indicated by a flashing dot on the radar. Use the warp drive or forward thrust to speed you to the target ship, as dodging brings hordes of hostile fighters. Drive close enough, an approach speed of one or two will automatically teleport you into the ship. Move with the aid of a jet pack you can start your search for extra 'warp drives', flashing food units, more fuel

and shields. Beware of the scorching creatures which will deplete your energy and kill you if you collide with them. Once you have collected all you can, exit and find the next target ship.

For a cheap game styled on Elite this is not at all bad. To progress through the 11 ranks from Rookie to Space Hunter will not take an experienced Elite-ite too long. The documentation, as in many Mastertronic games is not very comprehensive. The graphics are realistic and the music is pleasantly relaxing after your ordeal with the fighters.

J.L.

Chimera

Firebird - Super Silver Range £3.95

4 7 7 7

THAT THE CRAFT ORBITING the earth is hostile is undeniable. It also appears that someone is going to have to

find out how much of a threat it represents and if possible destroy it. If you escape with your life, to reach the bottom!

As the airlock shuts behind you, you look around and see that you are in a large chamber with exits left and right and an exit in front of you blocked by what appears to be a giant microchip. The rooms are depicted in 3D block graphics, reminiscent of Ultima's Allen's Spectrum. The effect works well.

Distraction of the ship requires a four stage sequence and your only clue is that the first stage requires a spenser so it seems reasonable to get off looking for one. There is nothing much to stop you as you explore - nothing to shoot

- but certain areas are restricted to you at the start and kill you if you try to enter them. Time however is against you and your supplies of food and water soon disappear and have to be replenished as you find them.

You die if either level reaches zero. Objects are frequently hidden behind corners that you can't see and so detailed exploration is essential. A scrolling message keeps you informed of what's going on.

Chimera is an enjoyable arcade adventure but it lacks the sophistication of some of its bigger brothers.

G.B.H.

Friday the 13th

Danmark £3.95 C64 + joystick

7 8 6 7

FRIDAY THE 13TH IS BASED on the mythic movie of the same name. It's a tale of twisted revenge as homicidal maniac

Jason tries to avenge his mother's murder.

His wrath is turned against the innocent holiday makers

on the shores of Crystal Lake and the field of action covers 3D screens with blood. In addition there are three buildings: a church and a barn (four screens each plus a bungalow (2) screens). This gives Jason plenty of rooms to cleave.

The computer selects a character for you to play and it is your duty to look after the other players by heading them all into a room where you have placed a sanctuary area.

At some point you may have to aim yourself with one of the weapons being around and tackle Jason in combat. If you succeed in killing him, don't feel too secure, just when you

think you have seen the last of him, up he pops again feeling pretty cut-up about his last encounter.

The game is quite challenging to play and the graphics are blocky but pleasant. I don't really think that the quality of the game will really have as much sway with sales as the horrific subject matter. The playing instructions give hints on how to get the most from the horrifying screaming sound effects.

A gory study for the blood-thirsty lasses and just to squinch that third you get two floating blood capsules with the game.

J.D.

Enginforce

Byond Software EUSL C64 - Logitech

THE ENGINEERS BACK WHEN Enginforce try to overcome the deadly General Zoff. This is the expected sequel to Shadowfire and the gameplay is even more advanced than before.

Having captured Zoff in the previous game, four members

of the force were accompanying Zoff to his trial when their ship crashed on a remote planet. This involves the team in much frantic searching and the game allows you to disperse your force as you see fit. Each member can be located and relocated whenever necessary and the activity selection panel on the lower half of the split-screen is used to issue commands.

Enginforce consists of Zark, Mentor the team leader, Syllik the strong warrior, Senisa, Maim the marksman and locksmith, and last but not least Maul the combat Droid.

As the team goes from location to location they can pick up objects which are lying there but care has to be taken to ensure that each player's special skills are covered for.

When the commander has been located, the rest of the team must be searched for the only visible spacecraft on the planet. Zoff is also searching and must be stopped and captured before Republican destroyers begin to blast the planet to smithereens.

The activity panel is fairly complex and it takes a little time to familiarise yourself with it. At the top a picture of each team member and if the crosshair selector is placed over one of these panels and the fire button pressed then you are

immediately shown that team member's current location. You can now use the arrow keys to dictate a direction for that character to take or select a sequence of actions for them to perform. At first it is relatively simple to use the panel but as the game progresses and the action heats up, you have to keep your wits about you and your joystick on the move.

Action commands are like an icon driven version of an adventure command. For example, you'd pick up explosives you first select Maul's icon panel, then check the inventory of objects around to see that the explosives icon is there and place the crosshair over the pickup icon. If the button is pressed when the crosshair has been moved over the explosive icon, it will move across into the panel showing the list of objects carried by Maul.

As you can guess the game and the graphics are very sophisticated and put many similar multi-screen games to shame. It just shows what can be done with the 64 in the hands of an intelligent programmer. Smooth animation of each character's movement adds cartoon realism to the game and the excitement of the many skirmishes should hold your attention for hours.

EUSL

The Human Race

Masterbyte EUSL

THE HUMAN RACE BOOK 500,000,000 to develop man and believe me it will take you a many hours to complete this

game. The idea is quite simple—you have to develop a rather ugly and stupid ape into a man, remember Darwin's theory!

This is achieved by completing each screen after which the ape slowly develops its manly features.

The game begins in prehistoric times complete with a large dinosaurs, dragonfly, pterodactyl and lots of bananas. Your task is to get the ape to the largest banana whilst avoiding contact with the roaring dinosaurs. The route to the banana appears very straightforward but it requires some thought if you are to reach it. Once completed chapter two begins.

Here the ape is sent forward to the age of lava and fireballs. His task is to reach the oval of a

moving pathway without falling off or getting hit by a lurking fireball. This screen belongs in something like Journey To The Centre Of The Earth!

As the game continues the task become very difficult but still enjoyable and certainly provide a good challenge.

The graphics aren't the best I've seen and there is a rather annoying delay every time a life is lost but generally the game provides excellent value for money.

Go ahead and buy it and watch out for a lovely koinkorck that would be worthy of any Tarzan!

EUSL

You don't have to be mad to work here, but it helps. Marie Curry visited Ian Stewart at Gremlin Graphics.

Gremlin GRILLING

THERE'S A LITTLE GREEN MAN ALIVE and well and living in Sheffield. This pre-coloured gremlin has made his home there since June 1984 and the climate seems to agree with him.

Gremlin Graphics is a small compact outfit run by the exuberant Ian Stewart who defines himself as the inspiration behind many of his company's products. Entering the micro industry through Laskey's first computer outlet in Sheffield, he soon realised that there were opportunities for a bright young man in this youthful business.

Inspired with this confidence, Ian opened Sheffield's first specialist computer shop aptly named, Just Micro. The vibrant look off and Just Micro did just fine. It was less than a year later that the gremlin got into the works.

In the summer of 1984, Ian and partner, Kevin Notburn, took the plunge, caught the gremlin and stuck him in some headworn outgaiter to form Gremlin Graphics. Since this was done there was no going back and Wasted, Monty-Mole, Gremlin's first game, was launched amid a blaze of publicity. The success strike was then entering the long and not so hot summer and the Gremlin Graphics boys see the potential of Arthur Scargill's activities as material for a computer game storyline. Because of its topical content the game was treated in wide coverage on both national television and radio and became a chart success giving the way for two subsequent Monty games.

Ian Stewart believes that a major reason for Gremlin Graphics's continued success in the production of popular games is the connection which is closely maintained with Just Micro. All Gremlin's games are extensively tested on unsuspecting members of the public who innocently venture into the shop. "Customers are excellent bug fighters," commented Ian. "Our programmers may test a game for days without finding anything, then one of the kids will come across a bug in a few minutes of play."

The Gremlin outfit listens very carefully to the comments of the customers who try out new products. Ian citily summed up the Gremlin policy in this area: "If we don't get the reaction we want then we scrap it." Simple but effective.

Many Gremlin game ideas are built up around a central central character and this seems to have become a successful technique. Names such as Potty Pigeon, Sam Scot Safebreaker and Thing on a

Spring came to mind. "We like to base a game around a particular character to stimulate the imagination of the player," said Ian. "We tend to concentrate on arcade games because they give an outlet to the sense of humour which is a ruling principle at Gremlin. Wherever I am, I'm always thinking of new ideas for games."

There are only four full time programmers at Gremlin, other work is done by about 10 regular freelancers. Pete Harrop who wrote the original Monty-Mole is now a permanent member of staff. His association with Ian Stewart began when his Spectrum broke down and Just Micro lent him another until it was repaired, Ian said. "Pete was a customer in the shop and we realised he had great programming ability. We lent him the Spectrum and it just went on from there." However, Sheffield natives with debutant computers shouldn't rush round to try and get a loan of a machine.

The full time programmers at Gremlin are now collaborating to produce a series of games based on the popular role-playing books. The War of the Tapes. The books revolve around the adventures of Avenger, a Ninja warrior. Work on the series is progressing and the first game should be available in February. Although programmers at Gremlin have always worked together to a certain extent this is the first project into which the team have plunged their joint efforts from its inception and the co-operation between them has been extremely successful. Praising his boys, Ian said, "Areas which need improvement can be sorted out through collaboration. There's never a cross word between them." There will be four games in the series when it is

completed and they will all follow a similar story line to the books.

Another new game, Bourdes, features the incredible antics of a bouncing tennis ball. It's certainly a different concept for a game as the ball bounces round the screen and then bounces back into the distance. Gremlin's programmers have even got you on it! According to Ian the game comes in a value for money pack with another game, entitled Metabols, on the back of the cassette.

C-16 and Plus/4 games are an important part of the Gremlin range and owners will be pleased to know that Gremlin has no intention of discontinuing this commitment to these machines. There are probably around 80,000 C-16 and Plus/4 owners in the country now and there are very few software houses which take notice of them. Looking at the situation in the cold light of day Ian remarked: "The less people that produce games for the C-16 and Plus/4, the better for Gremlin." A recently released compilation contains four games for £9.99 so the neglected users can really get ripping.

Ian obviously believes he's got his policy right but he stresses the fact that above all the computer industry is a lot of fun. "The main strength of Gremlin is the atmosphere in the firm. This makes for a good working situation and consequently good products," he remarked almost dreamt out by the tapping notes from next door and the blast of electronic music from a neighbouring office.

When asked to sum up Gremlin as a software house, Ian makes the place sound more like a lunatic asylum. "Basically we're a barmy lot up here."

MISSIVES

Every program that we publish in the magazine is very thoroughly tested before we print it.

The listings in the magazine are not typewritten anyway. What we actually do is get a printout of the program which is then placed on the page as artwork. This leaves very little chance for errors to occur.

Obviously errors do creep in sometimes. When they do we always publish corrections in the magazine. Corrections don't usually appear in the next issue of Your Commodore but sometime after that. This is because when one issue is in one state another is just about ready to be printed.

Most of the time the errors are made by the person typing the listing into the machine. We make many many times per check them for little errors (double through) to avoid to help you with this we will often to send a new computer listing to anyone having problems with a program if they send us a stamped self-addressed envelope and state clearly what they require.

In the near future we are hoping to start a software service where all of the programs in a particular issue will be available on cassette but we have no firm date for this as yet.

In the meantime a couple of features that will try to give you some hints about debugging programs have been commissioned. And, being honest, fault finding a program is an extremely good way of learning about programming. Perhaps we should start a spot the alternative mistake page!

Coming back to the System 64 program it appears that the programmer made a few mistakes when he wrote the program. He only defines the name and not the address. This is done in the Fort routine. This is the type of mistake that it is not always possible to spot so please make sure that you give any programs sent to the magazine a thorough testing before you stick them in the post. Anyway here are the days that will need to be added to delete a whole record.

Too Many Ads!

I am writing to complain about the recent change which has occurred since the merging of Your Commodore and Your 64. It has come to my attention that there has been a substantial increase in the amount of advertisements, at least 25% in the December issue. As I subscribe to your magazine I am worried that the amount of advertisements may increase even further in the future.

I would also like to see in the magazine an extra page of Hippo (in Arkville) in exchange for one less page of Sense of Adventure, as I feel that Hippo is far more interesting.

A suggestion I have for your monthly competition is, perhaps, that you should ask people to send in the best one line program or the best game or utility using no more than 100 lines since a spot the difference competition does not involve the use of a computer in any way.

I hope that the points I have brought to your attention will help to make your magazine even more absorbing.

Raymond Webb, Coasting

Thanks for your comments, Raymond. It's always interesting to find out what people think of the magazine. Your main worry seems to be concerning advertising. This worry greatly throughout the year and leads to the Christmas because manufacturers want to make the most of the extra money we all spend. Advertising forms a large part of our income and it is therefore essential that we carry a certain amount in order to keep up the standard of the magazine as a whole.

As an arcade game fan, we can bring you some good news. In the near future we will be talking some more ideas from your site to improve our arcade coverage. However, adventure games needn't worry because, you won't hear from this at all.

As for your comment on our competitions, Raymond. We do try and run the occasional different one, but the beauty of a spot the difference competition is that anyone can enter, and they needn't have any knowledge of programming to do so. Since the prizes are usually games of some sort, then it seems illogical to set a problem which only programmers can answer.

Yet another bundle of replies to your letters.

Problems, Problems

I WAS DELIGHTED WHEN THE PROGRAM System 64 by J. A. Wolfe appeared in the August issue of the magazine. I was able to enter all the addresses of my associates and it worked well. That is to say a real this week!

I wanted to amend the address of a colleague who had moved house. So, using option 1 'Delete Record', I cancelled the old address and re-entered the new address on the end of the list of addresses.

Imagine my disappointment when I printed out a fresh list of addresses to find that every single address after the one I had deleted now had the wrong name. It appears that the deletion in your program only erases the name and not the whole address. I have studied the programming but have been unable to amend it. Can you help?

Bill Paterson, Glenwood

I have typed in the Home Accounts program from your magazine. However it cannot seem to get it to work.

I have checked my program against the one printed in the magazine and can't find any errors. I haven't seen any corrections printed for this program but I believe that the error is yours and not mine.

Why don't you check your programs before you print them in the magazine as it would no doubt solve many problems!

A Shewood, Brillington

Every page delivered to the Your Commodore office is guaranteed to have quite a large number of letters similar to the ones above. So it is probably worth making a few points clear.

LANGUAGE

HOLD

LAB—

David Janda takes control and guides you through Commodore's Pilot package.

THIS MONTH'S LANGUAGE LAB is rather different from those in previous issues. Presented here is a brief introduction to a language that is very popular in the educational field in America. No, it's not Logo, but Pilot, and in my opinion, it would be just as popular if it was given the amount of attention it deserves. Commodore Pilot is the only package which is being reviewed, and the surprising thing is that the Commodore version of standard Pilot (known as *comshare Pilot*) includes many facilities not found in the standard.

It is worth pointing out that although the language is designed to be used by educators to write interactive educational programs, it does have its attractions for the programmer. The reason I say this is because of pattern matching.

It can be said that the job of a programmer is to solve the problem at hand. In educational programs this can be quite difficult as there is a lot of user input which has to be interrogated. This is not so

easy, and programmers normally find themselves spending a lot of time writing routines that interrogate user input. This can distract them from the job at hand — i.e. solving the problem!

Pilot incorporates a number of tools that facilitate the interrogation of user input, thus leaving the programmer to get on with the main task. These tools can be applied to problems associated with string manipulation and pattern matching.

Pilot — The Language

Pilot is a computer assisted instructional (CAI) language, which is designed for teachers to produce educational programs — convenient as the manual terms it. The idea behind Pilot is that it should be easy for teachers to produce programs that interact with the student on a question and answer level.

The version which is supplied on disk will run Commodore Pilot programs, and do a lot more since extensions have been added. These allow for the use of colour, graphics and sprites. An example is that text windows may be set up to allow for questions and answers to be displayed on different sections of the screen.

Graphics are catered for with commands to allow lines to be drawn/printed as well as filled in with colour. A group of sprite and colour commands is also included, and the extensions facilitate the use of the advanced features of the CB4.

The syntax of Pilot is very simple. Pilot instructions consist of several parts. First, there is a one-letter opcode (of which there are 26). The opcode is then optionally followed by a modifier which changes the way the opcode is going to be executed. Conditions can then follow and they can determine whether the instruction is to be carried out. This is best described with an example:

```
TQ(A#5): Correct, the answer is 5.
```

Here the opcode T means print something, but the screen is first cleared with the modifier S. The condition is that the answer A equals five, and if so the text in the field (everything following the colon) will be printed.

Unlike Basic, Pilot does not require strings to be enclosed in quotes. Instead, the string variable or literal is placed after the separator. This very simple Pilot program demonstrates this:

```
T: This will be printed
```

This will simply display "This will be printed" at the current cursor location. However, a return is also printed after each occurrence of the T command. It is possible to 'hold', or keep the cursor on the same line by using the H modifier.

```
!0: What is your name
```

This will display the message, and any answer will be entered on the same line (it is important to leave two spaces after the message).

Pilot Data Types

Maths in Pilot is integer only which is a bit of a restriction. The range is between -32768 and +32767. Another restriction is that only 26 variables are allowed for.

Performing calculations is done with the computer instruction which takes the form of C. Variables assignment and printing the values of variables requires a I character to precede the variable name.

```
C:A=2+2 — assigns A with 4  
C:B=(2-2)*(2+1) — assigns B with 0  
T:There is a sum...  
!0: 2+2  
C:A=2+2  
I:A  
T:There, the answer is 4A
```

strings are handled in a very flexible way. But, as mentioned Pilot only has 26 variables available so it is not possible to have a string and a numeric variable of the same letter.

Before a variable can be used as a string, it must first be dimensioned with its maximum length. Pilot allows a maximum string length of 255, and the command used to dimension string is D. The \$ character is used to identify that the variable is a string, but this is not absolutely necessary.

D:A\$(10)

The computer command is used to assign a string variable with a value. In this case, it is necessary to use quotes. When using the T command to print the contents of a string variable a \$ character is used to precede the variable.

D:A\$(14)

```
C:A$="Your Commodore"  
T:This magazine is called $A$
```

The C command is very flexible when it comes to string assignment. Strings can be assigned with sub-strings, concatenation and so on. Indexing is allowed which can be used to reference an object string.

D:A\$(18)

```
D:B$(20)  
C:obj$="This is funny"  
C:IB$="This is not very funny"  
C:obj$(2)=IB$(1:4)  
T:$A$
```

Would print: "This is very funny".
Concatenation is also possible using the # operator.

D:A\$(4)

```
D:R$(7)  
D:C$(70)  
C:A$(6)="Hello"  
C:R$(6)=A$(1:6)  
C:C$(4)=R$(1:4)  
T:R$
```

Would print: "Hello reader".

Getting user input into the micro is very simple in Pilot. A pre-defined input buffer called \$I\$ is used to store user input. It works like this:

```
T:Hello, who are you?  
A:  
T:Please do not meet you $I$
```

Notice that like ordinary string variables, the input buffer requires the \$ to be prefixed to the buffer name when it is being printed.

The A is the accept command, and it can work with numeric and string

variables as well as the input buffer variable:

```
D:A$(10)  
T:What is your name?  
A:$I$  
T:And how old are you $A$ ?  
A:18  
T:You are 18 years old then $A$
```

The problem with user input is that you don't always get it in the format you wanted. Some people would enter their names in upper case, some lower, and some as a mixture of both. This can be a real headache especially if the input is to be processed. Pilot provides a problem command PR that allows input to be "converted" into a specified choice. PR:U will convert all input to upper case, PR:L to lower and PR:S will strip any input of spaces. PR:Z will reset the options.

The Clever Stuff

Pattern matching is achieved with the match command M. Assuming we wanted to check that the user reads this mag, we could pose the question and process the answer using this program:

```
T:What Commodore magazine do you read?  
M:Your Commodore
```

A:

Now, if the answer entered was "I read a magazine called Your Commodore which I think is great", believe it or not a match would be made. This is because Pilot does the hard work involved in matching (called window searching) though the users input checking to see if there is a match.

Problems with this are that the user may enter the answer in upper or lower case. To still get a match the PR command would be used before the match command to convert the input.

Match used with the \$ modifier will only accept answers that are spell incorrectly! The S modifier will accept an answer even if one letter is wrong, or if a pair of characters have been swapped - very handy!

More flexibility is allowed with the * and & characters when used in the match command:

```
M:Com*adore
```

This simply means "accept any letter in place of the *". The & means any number of characters.

Summary

There are many, many other features to the Pilot language. Jumping, subroutines,

multiple choice tests, even nesting is possible. All these features make Pilot a very practical tool for educational programming.

The language does suffer in some areas though. The restriction on the number and length of variables is a serious one, as is the lack of floating point maths. But these faults are common to the Pilot standard, and are not unique to Commodore's implementation.

Even though the language is very powerful, it is not very hard to learn. Commodore Pilot has 20 commands with modifiers and because the syntax is very simple, it is quite possible to write complex programs in a very short time.

I would strongly recommend Pilot to anyone who wishes to write programs that involve processing interactive answers. The features available in the language enable the programmer to 'get on with the job'.

Commodore Pilot

Commodore Pilot is supplied on disk only, together with a very good 111 page tutorial/instruction manual. Two versions of the Pilot interpreter are supplied on the distribution disk: a development version which is used to write, edit and run Pilot programs, and a run only version that is identical except programs can only be loaded and run.

Other files on the disk include three demonstration programs, a simple sprite editor written in Pilot, and a Pilot program that enables the user to experiment with sounds on the C64.

The actual Pilot package has four modes of operation. First there is the edit mode which is used for program creation and editing. The run mode is for running the program, and the command mode is used for loading, saving and printing programs. Finally, the immediate mode (which is similar to Basic's immediate mode) allows the programmer to experiment with Pilot by trying out Pilot commands one at a time. This mode is very handy when learning the language.

Graphics on a 128x256 grid are catered for. Pictures can be plotted and centred, lines drawn and the graphics origin changed. Both text and graphics can be freely mixed and a split-screen command allows the screen to be divided between graphics/text output and prompts/user input.

Other features include sound, sprites and user definable characters, although I must say that these could have been implemented in a more friendly way.

Commodore Pilot not only conforms to the standard common Pilot, but also includes many new features (some of which I have mentioned). The package is an eye opener to use which is a blessing. Highly recommended!

PROGRAMMER OF THE YEAR

Commodore

This month's entry is

Spike, an excellent

game by Shane

Stevens.

A LARGE NUMBER OF GAMES have been entered for the Programmer of the Year Competition. Spike is certainly an above average entry. It is definitely worth the effort of trying it in.

In the game you find yourself as Spike, travelling around a Power Grid. Hidden somewhere within the grid is your trusty CIA. Your job is to find it. Of course, life isn't easy and the Sparks brothers are out to get you. The number of sparks charging around the grid depends on the level at which you choose to play, there are nine in all.

Full playing instructions are included in the game so there is no need giving them here.

Getting it All in

Spike is in two parts. The first part is in Basic and should be typed in and saved on to tape or disk. Make sure you read the page that tells you all about our method of printing listings. Before you start if you don't want [HOME] - Off.

If you are using a cassette then make sure that you change the

LOAD "SPIKE",0,1

in line 40 to:

LOAD "SPIKE",1,1

Once you have SAVED the Basic you can then tackle the machine code. Yes, I know that there's a lot of it but we have tried to make it as easy as possible for you.

Whereas in this magazine you will find the Year Commodore Easy Entry program. You should type this in and save on something safe. You will need this for most of the machine code programs in Year Commodore. RUN this and follow the instructions with the Easy Entry article. Don't forget each line is checked as you type it in and you can SAVE what you have entered at any time.

Make sure you SAVE it before you attempt to RUN it.

Spike should be SAVED straight after the SPIKE LOADER and is SAVED between the following locations:

Start Address : 32504
End Address : 32560

Remember to press F1 in the Easy Entry program to activate the SAVE routine, and

make sure you save the program with the name SPIKE.

And On We Go

Now that you have both parts stored on tape you simply have to LOAD and RUN the SPIKE LOADER program. This will automatically LOAD the second part and the game will start to RUN.
Have fun!

Program: Spike Load

Nick Hampshire brings
you some more
commands to
improve your Basic.

BUILD A BETTER BASIC

IN THE LAST FOUR ARTICLES in this series I have given all the initialization and wedge routines needed to add extra commands to the Basic of a C64 computer. I have also given the code to add 12 new commands which are: CTL, APPEND, CHANGE, DUMP, FIND, AUTO, CHAIN, DELETE, RENUMBER, MARK, SORT and WAPTR.

This month I am adding a further eight commands. These are: CATALOG, DSK, EXEC, MERGE, GET, PUT, TYPE and OLD. Seven of the eight are special-disk control commands, and eight (OLD) is included since it is called by the other routines. These disk control commands add some very powerful and useful features to a disk based 64 system and will save a considerable amount of programming time.

All eight new commands require that the wedge and initialization code given in the first issue are present in memory at the correct locations, and that their command names and entry points are stored in the correct tables. These eight commands are independent of all the previously added commands - except APPEND - routines from which are required by the new routines. Within this limitation they can be used without the previously added code. To ensure that you have the wedges and new routines correctly positioned, the Basic loader at the end of this article gives the initialization routines and all commands.

In next month's issue I will show how to write and add your own commands to Basic. All the programs used in this series are extracted from the book *Advanced Commodore 64 Basic* (revised) by Nick Hampshire and published by Collins.

GET

Abbreviated entry: C64PPE
Affected Basic abbreviations: None
Notes: Integer Hex SET, SOF, Decimal 28.35

Mode: Direct and program
Recommended reader: follow; differing effects in direct mode and program mode

Purpose: To input an ASCII file on disk into memory with line numbers created from 1000 in steps of 10. GET will read in files created by the Commodore assembler and SYNTAX. Each time is read in and a carriage return is reached, it is then tokenized and entered into memory as a program line.
System: Direct mode: GET filename, d - where d is the device number (disk only)

Run mode: as chapter 7.087 and GET 8.

Errors: Illegal device - if the device number specified is less than eight - Missing file - Missing file name - if a null filename is specified.

File not found - if the file does not exist

Device not present - connected file opens error - if 80 files are already open

Disk errors - at the end, the disk error channel is read and displayed.

Uses for editing: Commodore assembler files or files for the use of the BASIC command
Routine entry point: 58071

Routine operation: The GET routine first checks whether the computer is in run mode or direct. If it is in run mode, then the Basic version of GET is performed. If in direct mode, the file parameters are read in and

checked for a null filename or the device not being disk. If these checks are OK, the message 'reading' filename is displayed and the file is opened. Each line is then input and stored in the input buffer, tokenized, and entered into memory until the end of file marker is reached. The program is then re-chained and the variable pointers are set to the correct values for the program. Finally the disk error channel is set and displayed.

CATALOG

Abbreviation: CATALOG

Affected Basic abbreviations:
NONE

Index: Has 80,805, Decimal
38,1

Index: Direct and program

Recommended mode: Direct

Purpose: To display the directory (CATALOG) of a disk in drive unit BIGHT. This command will display the directory straight to the screen without having to load it in.

Users of dual-disk drives will be pleased to note that you can specify which drive to display by either a number one or zero after the command. If no number is specified, the routine will default to drive zero.

Syntax: CATALOG [0 or 1]
Errors: Syntax error - if the command "CATALOG" is followed by anything but "0," "1" or nothing.

Disk write message - after the CATALOG has been displayed,

the disk error channel is read and displayed.

Use: The command is used to display the directory of a disk. This can be useful if you have a program that you wish to save but need to check if there is room on the disk or find a filename to use. The directory can be paused when displaying, by use of the spacebar, and resumed with any key. Display can be stopped completely with the STOP key.

Routine entry point: 48986

Routine operations: On entry, the routine checks to see if a drive number is specified. If no number is specified or zero, the character "0" is inserted into the filename after the "0". If it is a one, the character "1" is inserted. Anything else will cause system error. The file is then opened and each line is read and displayed ignoring linefeeds. When the directory is finished, the file is closed and the disk error channel is read. Check in the one following page.

DISK

Abbreviated entry: `Control`
Affected Basic abbreviations:
`DIRM - DIRM`
`Talkies: Hex $40-$5A, Decimal 256-102`

Master Direct and program Recommendations make further Progress: To send a disk command to the disk unit eight.

Syntax: `DISK [string expression]`
—where the string expression is:

`"00-TEST"` - to scratch the file test.

`"$0-DIRM,00"` - to reformat the entire disk.

The other syntax is `DISK` which will display the disk error message to the screen giving a message like:

13. READ ERROR 16.00

where 13 is the error number, 16 is the track, 01 is the sector, and READ ERROR is the error description.

Basic Syntax error - if the first character of the command is not a quote character. String too long - if the command is over 256 bytes long.

Type mismatch - if the command is a number, not a string.

Note: This command is useful in checking errors caused from disk access by using just `DIRM` which displays the message. A Basic equivalent would be:

```
OPEN 15,0,0  
INFLD # 13,16,01,0,0  
PRINT #1, "READ", "T", "S", "  
CLOSE #1
```

Also: For sending disk commands such as scratch a file etc:

```
DISK "00"  
is equivalent to:  
OPEN 15,0,11,"00"
```

For disk commands refer to the disk unit manual.

Routine entry point: 00440.

Routine operation: The `DISK` routine checks to see if anything follows the command. If not the error channel is read and displayed. If there is text after the command (which must start with the quote character) the text is read in and sent in the open command. Before either of these two operations are actioned, the current file is closed.

EXEC

Abbreviated entry: (initial) Altered Basic abbreviations: EXP - EXP
 Dollars: Hex \$00,000, Decimal 200.00

Modem: Direct and program Recommended mode: Direct only

Purpose: To EXECute a text file stored on disk. This command works in conjunction with GET and PUT.

Syntax: EXEC filename.# - where # is the device number (disk only).

Access: illegal device - # the device number specified is less than eight.

Missing filename: - if a null filename is specified. File not found - if the file does not exist.

Device not present: - if no disk drive is connected. Too many files - if 10 files are already open.

Disk error: - at the end, the disk error channel is read and displayed.

User EXEC can be used in several different ways. The main one is to set up function keys when first powered up; for example enter the program:

```

20 CTRL,0A,11
30 RTN,"CATALOG"<CHR(10)
40 RTN,"EXEC"<CHR(10)
50 RTN,"LIST"<CHR(10)
60 RTN,"RUN"<CHR(10)
70 RTN,"CLOSE"<CHR(10)
80 RTN,"FILES"
90 RTN,"WARM,START"
95 RTN,"RESET"
100 PRINT CTL(12,12,...,1)
"FUNCTION KEYS DEFINED"

```

Use the PUT command to write this to a disk file: PUT"FK".#

When powered up, type EXEC"FK".# and the commands will be carried out and your function keys will be defined.

Other users could be a string of change commands to a program.

Baseline entry points: (M000) Routine operations: The filename and device number are read in and the file is opened. Each line is read into the input buffer until carriage return is found. It is then tokenized, and executed until the file is complete or an operating error occurs.

MERGE

Abbreviated entry: MERGE
Affected Basic abbreviations:
None

Tokens: Hex 80,81,72, Decimal 258,78

Modes: Direct and program
Recommended mode: Direct only

Purpose: To merge a Basic program from disk into the current Basic program in memory.

System: MERGE filename,d - where d is the device number (disk only).

Error: illegal device - if the device number specified is less than eight.

Missing filename: - if a null filename is specified.

File not found: - if the file does not exist.

Device not present: - if no disk drive is connected.

File open error: - if 10 files are already open.

Disk error: - at the end, the disk error channel is read and displayed.

Use: Merge is used to combine two Basic programs in memory. Each line of the program on disk is read in and the zero byte is reached, and stored in the input buffer. The Basic routine to enter a line is then called and the line is entered at the console prompt. Note: If a line number of the program to MERGE is the same as an

existing line number, the ASCII'd line will replace it.

Routine entry point: 25780

Routine operations: The filename and device are read in and checked for missing filename and illegal device. If both checks are OK, the file is opened and the message MERGING is displayed. Each line is then read into the input buffer and entered into the Basic routine to do so. When the file is completed, it is closed and the disk error channel is read and displayed.

OLD

Abbreviated entry: OLD
Affected Basic abbreviations:
None

Tokens: Hex 82E, 81E, Decimal 208,77

Modes: Direct and program
Recommended mode: Direct only (there should be no program in memory)

Purpose: To restore a Basic program after a NEW has been performed.

System: OLD

Error: None

Use: OLD can be used if the program in memory has been wiped out using the NEW command. OLD will not work if DELITE was used to remove the whole program or if a variable has been declared since the NEW. In most cases, syntax error will create a variable e.g. LI instead of LITHE will create the variable LI and give syntax error instead of trying to list the program.

Routine entry point: 25885

Routine operations: The first line is scanned until the end and the pointer to the next line is returned. The program is then re-compiled and variable pointers are set.

PLIT

Abbreviated entry: PLIT
Affected Basic abbreviations:
None

Tokens: Hex 80,81,72, Decimal 258,77

Modes: Direct and program
Recommended mode: Direct

Purpose: To list a Basic program in a disk file without line numbers.

System: PLIT filename,d - where d is the device number (disk only).

Error: illegal device - if the device number specified is less than eight.

Missing filename: - if a null filename is specified.

Garry Marshall
explains how a
computer can be used
to interpret images.

PROGRAMMING PROJECTS

IN MANY AREAS, computers are used to help interpret images such as that in Figure 1. The illustration shows a portion of the sky as seen from a powerful telescope, and computers are used to process pictures of the kind to make sense of them in terms of the galaxies and clusters of objects appearing in them. A similar process takes place in giving a robot the capability to see. To be able to recognize the items that it is to assemble, for instance, an industrial robot must be able to interpret the pattern of dark or light spots representing its field of vision as presented by a video camera. In both cases, the computer is running a program that enables it to bring some kind of order to an apparently chaotic scene.

There is another area where computers can be used to help interpret images, and this is in archaeology. Often on a site excavated by archaeologists, the only evidence remaining of a building that once occupied the site is a pattern of holes in the ground. After the building itself has decayed, the holes in which its supporting timbers were placed (known as post-holes) remain. Even for a single building, which will obviously have a rectangular plan, the plan itself is often some two clear. When many buildings have occupied a site at different times with some built over the same ground as earlier, vanished, ones, the overlapping patterns of holes can be chaotic. Computers can be used to good effect in trying to reconstruct the plans of the houses that once occupied a site.

This month's project is to reconstruct the plan of a building from an irregular but near-or-less rectangular pattern of post-holes such as that in Figure 2 by superimposing an outline of the plan on it, as shown in Figure 3.

Figure 1 Chaos in the skies

Figure 2 Post-holes with rectangular plan superimposed

Figure 3 A pattern of post-holes

Figure 4 Good and bad approximation to the main axis for a pattern of post-holes

The Solution

The first thing the program must do is to plot the pattern of post-holes as in Figure 2. This can be done by reading the positions of the post-holes from DATA statements and then plotting a black at each position to represent a post-hole. The positions will be needed again later in finding the plan of the house, so it is worth storing them in arrays as they are read. Using arrays named XP and YP to hold respectively, the x- and y-coordinates and row positions on the screen for the post-holes, and making use of our point-plotting sub-routine, which begins with line 1000, the program starts as:

```
10 DIM XP(10), YP(10), S(10),  
11 Y(10), NP(1)  
20 GOSUB 500: REM PREPARE  
41-85 SCREEN  
30 FOR I=1 TO 10  
40 READ C, R: SP(1)=C: YP(I)=R
```

```
50 GOSUB 1800: C=C*1:  
60 Y(1)=1000: REM PLOT  
POINT  
65 FOR I=1 TO 10: GOSUB 1000: C=C+1:  
70 GOSUB 1000  
75 NEXT I  
80 DATA 45, 51, 42, 41, 48, 77,  
120, 55, 185, 105, 188, 118  
90 DATA 105, 111, 82, 121, 49,  
111, 55, 110, 55, 83, 43, 79
```

The next step is to find the main axis of the house, by doing this we shall find the directions of all the walls of the house. The longer walls will be parallel to the axis and the shorter walls must be at right angles to it. Figure 4 shows the idea behind the method for finding the main axis. It shows a line that goes close to the positions of all the post-holes and a second line that obviously goes much further from most of them. The first represents a good approximation to the main axis, and the second a poor one. We shall use a well-

known mathematical method for finding the line passing closest to a set of points, and this will give us the main axis of the house. The method is that of finding the line giving the "best least squares fit" to a set of points.

We will write the program so that it waits until a key is pressed before going on to calculate the position of the main axis and to display it using our line-drawing sub-routine that starts at line 3000. This gives the next section of the program as:

```
180 GET C$: IF C$="" THEN  
190 FOR I=1 TO 11: N(I)=XP(I)-  
Y(I)*PI: NEXT I  
200 GOSUB 1800: REM FIND  
AND DRAW LINE
```

The subroutine that does all the work is:

```
2000 REM FIND AND DRAW  
LINE  
3000 L=0: S=0: T=0: SP=0  
3100 FOR I=1 TO NP
```

**Runicaster delves into some
dungeons and dragons games
and faces danger and death.**

New and Devious...

GLIMB is a RELATIVELY NEW NAME in computer software and is the company's first adventure game - *The Magician's Ball* - is anything to go for it will be worth watching out for in the future. It is by no means perfect as there are several anomalies apparent in playing it... but nevertheless the presentation and the command structure are good and sufficiently different to make it worth your attention.

The program is on cassette only and will run on the C164 (or C128). A fast loader is incorporated and the program will load in just over four minutes. The screen display is colourful and the text scrolls well, with the graphic picture of your location occupying a small rectangle in the top-left corner.

The graphics are not particularly exciting but are clear and are shown very sparsely. Occasional use of sprites adds some movement that gives a little life to the scenes. Unlike some games the pictures, although simple are quite different and easily give quick visual recognition to one's location.

The main location-description is to the right of the picture and contains plenty of information to build quite a fair mental image of your surroundings. Visible items are indicated and input commands are entered at the bottom of the screen.

The 12 line 'window' between the description and the command line will contain additional information as what is seen at that location - a creature, objects that can be carried and even what other creatures are carrying!

Early in the storyline it is that an evil magician has abducted a beautiful princess from her father's side; you - Glimb - save those at the time and in a headlong attempt to rescue the girl, get swept away by the magician's magic as he returned to his own domain. You arrive in the magician's realm and... are you sure?

Input commands may consist of reasonably complex sentences and also permit you to introduce characters what to do. A very interesting feature of this adventure is that you can help personalities and control some of the other characters you meet in your travels.

The normal 'new game' facilities are attended with 'saving' and 'loading' lines of just under two minutes but another way (not from Global to the 'Quicksave' and 'Quickload'). These are implemented by pressing the Commodore key and either 'S' or 'L'.

This 'new' option almost instantaneously stores your present position into a protected area of memory. A very useful command if you think you are about to be killed or even to create a 'fall back' position if you are not sure of your next few moves.

Further 'user friendly' options exist in the input command area - not only can you delete an unwanted letter by using the delete key in the normal manner but you can delete the entire command with **SHIFT** and **CLR**.

Pressing 'W' opens the list command and hitting the left arrow key (top left of the keyboard) recalls the last command for you to modify if desired. I think it is facilities such as these that make Global worth watching in the future; user friendly games are worth cultivating!

The operating system may be user friendly, the game is in many ways just plain devious! All the clues are there but you may have difficulty seeing the wood for the trees. There are several 'web-barring paths' and the number of objects you can carry is not always as great as you may wish - perhaps you should get someone/something to carry them for you!

Throughout your journey, you travel to magical accommodations from 'Tobular Bells', this provides a pleasant interlude as you go back to ponder your next move.

There are the occasional 'operational error' but these do not alter the game play in any way - they mainly appear as

various characters saying something that has no useful or significant purpose!

There are also a number of treasures where you will have to see location, has for more items that although different are similar - a gold and an ornamental key for instance. It is worth dropping the one you do not want to see if another has a hint as the program sometimes finds it difficult to understand what you want it to do!

The Magician's Ball is good fun and both novice and experienced adventurers should find something in it to enjoy.

Old But Fester

Once upon a time there were no C64s or C128s. I know that is difficult to believe but it's true. There were P1Ts and Atari's and TRX 80s and quite a number of programs for them.

Amongst these there were also a number of adventure games that closely followed the general idea of *Dungeons and Dragons*, with lots of monsters to meet in battle and treasure to be found by the bold and daring.

They caught the imagination of thousands of home computer users in America (the land of their origin) and there were even competitions and conventions where adventurers of the mind could compete against the clock to prove their prowess in the worlds of *Dungeons* and magical realms.

One of the favourites was called *The*

C16

**Derek Moody gives
more control to your
fingers with this article
for the C16.**

I PURCHASED A C16 AT THE end of March but horror of horrors, here was yet another Micro supplied with an inadequate manual. Commodore suggest that you should buy their Programmer's reference guide, but that doesn't even contain memory map, let alone operating system entry points or connector pinouts. First of all, I needed a decent keyboard control routine, so I disassembled the ROM and started searching for the necessary information. This article is based on some of the results.

The C16 detects keypresses and stores them, even when the computer is doing

something else. This is possible because the keyboard is being read in an interrupt routine, this routine also maintains the real time clock and does a certain amount of house-keeping for the operating system. The IRQ interrupt routine is called 60 times each second, and these are three points at which it is vectored through RAM, at \$112, \$114, and \$116. The vector that will be of most interest to us is at \$112, the computer refers to it after reset of the house-keeping, but before updating the real time clock and reading the keyboard. A vector, by the way, is an address held in two bytes of RAM, which points to a block of machine code in ROM, by altering a vector, the programmer can cause his own block of code to be used instead.

The keyboard is read by a short, 18 byte routine at \$0870 this works by writing the contents of the accumulator to the columns of the keyboard matrix, and reading the rows

back into the accumulator, the X and Y registers are preserved.

The keyboard matrix is shown in Figure 1. To select a column for reading, that column should be pulled low by writing a zero into the appropriate bit, while all the other columns should be held high, i.e., bit value 1. Therefore to select column 2, the number required is, in binary 0111011 or 59 or decimal 59. If no key on that column has been pressed, then the number returned will be 01111111 or 127 or decimal 127. If, however any key on that column has been depressed, then the appropriate bit(s) will be zero, for example, if both 'C' and 'T' were pressed, then the number would be 10101111 or 143 or decimal 143. To examine every key, requires the routine to be called eight times, once for each column. To detect whether ANY key has been pressed, send a zero to all columns, and if the returned value is not 255 then one, or more, keys must be pressed, although which key(s) will not be obvious.

The advantage of using this routine rather than the BASIC GET and GETKEY statement lies in the ability to detect and use multiple keypresses. PR001-BAM 1 serves as a useful example and reader. When RUN the program presents

```

an overview picture of the keyboard matrix, if any keys are held down, then the relevant matrix position is indicated, note that in this case the keys must be held down as the BASIC routine takes a half-over a second to record the current position. As the programme is written, it leaves the operating system keyscan attached, when you have got the programme running properly, add the following line.

```
78 POKE 78,190:POKE190,250
```

SAVE the version of the programme before you RUN it, this sets the vector at 190, and points it to the end of the interrupt routine, thus bypassing the normal keyscan, and leaving BASIC with no way of reacting to the keyboard. The new version of the programme does not recognise the RUN STOP key, and allows us to experiment at will.

In PROGRAM 1, TIC, points to the top left corner of the matrix as it is printed on the screen. IX, points to the data byte through which parameters are passed to and from the machine code routine, the machine code itself starts at 190+I, SIZ is the value that is passed to the machine code routine, SZ is the value returned, 190 is a value generated for comparison with

- PC[Array] List of player addresses.
- TC% Top left corner of screen.
- DN% Parameter address (as programme 1).
- P1% Player 1 position.
- P2% Player 2 position.
- S1 Player 1 score.
- S2 Player 2 score.
- T Flag, 0, or 'crash position'.
- M% Parameter passed to machine code.
- MOVES% Player position update value.
- ST% Random position of new star.
- R% Value returned from machine code.
- TT% Contents of new player 1 position.
- TT2% Contents of new player 2 position.
- ST1% Player 1 list start pointer.
- ST2% Player 2 list start pointer.
- ET1% Player 1 list end pointer.
- ET2% Player 2 list end pointer.

Note that PC% [array] is implemented as a circular list.

Let's have a practical example. PROGRAM 1 is a two player game that requires the detection of eight keys, several of which might be in use at any time. Each player has to have controls for up, down, left, and right, and in addition we must permit diagonal movement. To simplify the input routine, it is desirable that all of one player's controls should be on one column. It so happens that if we use column 1 for player 1, and column 5 for player 2, then there are suitably placed keys for both players on rows 1, 2, 4, and 5. The machine code in PROGRAM 2 is identical to that in programme 1, and the keyboards are made in the sub-routine at line 508. This time, rather than looking at the whole keyboard by means of eight column scans, only two scans are made, and the rest of the keyboard is ignored, however the interrupt vector is untouched, RUN STOP will work.

The programme is structured for clarity rather than speed, but despite this the game is quite playable.

The WINNERS

of the ASP DREAM HOLIDAY Competition

Argus Specialist Publications Ltd. are pleased to announce the winners of the fabulous Dream Holiday Competition.

First Prize

A holiday anywhere in the world up to a value of £2,500 has been awarded to Mr K. Goodbridge of 7, Rowland Road, Radcliffe, near Farnley, Nottingham NG3 2JF.

Second Prize

The very latest in portable video cameras awarded to Mrs C. E. Duffy of 104 Croxall Park Place, Beccles, Suffolk NR3 7JN.

Third Prize

The most popular BBC Model B Micro computer plus software package, awarded to Mrs P. W. Dawson of 1 Lydbrook Road, Merston, RG2 2JQ.

Fourth Prize

A superb Mitelco 500 computer with 32000 bits and 500 games in its own right, awarded to Mr Len Sullivan of 1, Millers Wood, Viper Village, Wingham, Kent TN32 5JF.

ASP would like to thank everyone who entered the competition, and CONGRATULATE all winners. Mr Goodbridge for his winning selection which was a prize winner.

"...to combat boredom by the beach, keep magazines in easy reach!"

SPRITE IDEAS

When you are designing a game one of the longest jobs is designing the sprites. If you are good at art then fine, if not your next monster will probably end up looking like a square box with legs.

Now, Your Commodore comes to the rescue once again with Sprite Ideas. If you have designed any sprites for games and you don't mind other people seeing your masterworks (even why not send them into us. Each month we will be offering \$10 for the best entries.

Your sprites can be anything at all (within reason), if you've designed a series of animated characters then send in the lot. We'd love to have a look at them.

So, next time you are after an Oge to put in your new game, have a look in this section of the magazine and you may find just what you are looking for.

EASY ENTRY EASY ENTRY

We make life easier

for you with our

machine code entry

program.

THE WORST THING ABOUT Machine Code programming is entering thousands of numbers and then finding that the program will not work. There is nothing else that you can do apart from going through all of the listing trying to locate that mistyped character which prevents the program from working correctly.

Now there's an easier way to enter your machine code programs. With the Your Commodore machine code entry program, each line of numbers is checked as soon as you press return. If you have made a mistake you will be asked to re-type the last line. Another added bonus is that you can save what you have entered at any time to tape or disk and carry on where you left off next time you come to your computer.

Using the Loader

Before you type in any machine code program you must have typed in the machine code entry program and have it saved onto tape or disk. When you want to enter any of the machine code programs that

are printed out in the form used by this program you must LOAD it into your computer. When you RUN the program you will be asked for the start address of the program. The start address is the first number in any machine code listing that appears before the colon (e.g. 49152). You simply type in this number and press return.

All that you have to do from then on is type in all the numbers on a line. Do not type any spaces and do not type returns, the program will do all of that for you. If you have made a mistake on any line the computer will ask you to type the line again. Once the line is entered correctly the computer will automatically prompt you for the next line of data.

Saving and Loading

You can save your data to tape or disk at any time by simply entering the F1 key as the first character on any line. You will then be asked for the start and end address of the save. The start address is the first number in the listing as already mentioned. The end address is the number of the last line plus 1. Don't forget to add 15 to the last line entered will not be saved.

To load back a program that you have saved you simply have to enter the F1 key as the first item on a line. You will then be asked for the name of the program.

DISC DISECTOR V3.0

The most advanced disc disector yet available. Features include:
 - Automatic disc detection
 - Precision alignment
 - Adjustable focus
 - High resolution output
 - Easy to use interface

Quickdisc+ ANYTYPED FILE DISPLAYS

Quickdisc+ is a revolutionary new way to view and manage your files. It allows you to see a graphical representation of your files and folders, making it much easier to navigate through your data. Whether you're looking for a specific document or trying to organize your files, Quickdisc+ has you covered. It's fast, efficient, and completely new.

Quickdisc+ is available in two versions: Standard and Professional. Both versions offer a wealth of features and options to suit your needs. Contact us today to learn more about this exciting new software.

WHAT IF SOMETHING GOES WRONG? CALL US NOW! 01249-41971

LONDON HOUSE, KINGSTON HILL, WIMBORNE, WILTSHIRE, WILT SN4 6AT
 TEL: 01249-41971

Dave Crisp takes a look at a handy utility that will allow you to re-align your disk drive.

How's Your Disk Drive?

APART FROM THE FACT THAT IT'S slow, does it also fail to load some of your software?

Well, the problem could be head alignment. That is, the part that moves over the disk in your drive. Because of the two types of metal used in the head mechanism high temperatures cause the metals to expand at different rates. The result of this is a sloppy head. The answer to this is to let the drive cool down and hopefully things will be OK again.

The other cause of mis-alignment is more serious. Have you noticed with some protected software the drive makes a hammering noise like a machine gun? This noise is the mechanism being 'bumped' against the stop. This repeated hammering will eventually knock the head out of position.

Would other computer owners put up with a situation where software can damage the hardware?

If you are suffering from a badly mis-aligned head then this software from Eyesham Micros may be the answer.

No Special Equipment

As far as I know this is the first disk of its type. For the first time it is possible to check and remedy head alignment without equipment such as oscilloscopes.

The disk itself has had its tracks recorded 'off-line' so that the program can interpret what it reads into a measurement.

When I received the copy of the software I was relieved as my heads were so mis-aligned that it was getting to a point where I was finding it difficult to get a directory of a disk let alone save programs with any degree of confidence.

The Tests

There are two main tests:

1 Speed and Clamping test

The speed at which the disk rotates in the drive is very important and the TST exam shows quickly whether this could be the first of your problems.

The software takes 30 measurements of your drives speed. This is then converted into an average speed. This average speed should be within $\pm 1\%$ of

300 rpm (TSC). If this is OK the difference between the fastest sample and the slowest sample is noted and if this is greater than 5% then this would result in a failure.

2 Radial Head Alignment

The program reads what data it can from off-track disk and shows the result on a chart.

The chart is made up of a display of asterisks which shows at a glance how far out your drive head is. The chart will also show whether the mis-alignment is to the inside or outside of the track.

In the manual provided there are 34 read-outs showing results and a remedy so whatever result you get you should be able to find a chart which looks something like the one you obtain.

There is a third test which checks the position of the TRACK 1 STOP.

This is a metal casting which stops the head moving further back than track one. It is possible for this casting to become misplaced which obviously results in the head mis-aligning with that track.

The program does a stop check and shows on the chart whether you need to re-align the stop.

A printout of a chart is shown below.

Doing The Work

If after doing the test you decide that some work on your drive is required the

manual will take you through the procedure step-by-step. There is not enough space here to allow me to go through the procedure but you would need confidence in your ability to poke around with a screwdriver without damaging anything. If in doubt find somebody who feels a little more confident.

Silence The Gun

You will also find in the manual a small envelope containing two soft metal springs. These replace the standard head stop. This is a simple job and one that is worth doing.

This does not stop the 'hammering' of the drive but it does make the hammering very quiet and less damaging. After fitting the 'quiet stop' run the test again to ensure that it is in the correct position.

Conclusion

This is a good buy if you envisage problems. Of course if your head is so far out of line already you will not be able to load the diagnostics anyway. It is a useful thing to have and one which most Commodore owners would find useful at some time in their drive's life.

At £28.95 it is not cheap but could pay for itself. It is available from: Eyesham Micros, Telephone: 0286 47869 or 971-48264.

Listings will be much easier to enter with our new system.

COMMODORE LISTINGS ARE RATHER well known for the horrible little black blobs that always abound. Unfortunately the graphics characters which are used to represent graphic and control characters do not reproduce very well and they are also difficult to find on the Commodore keyboard.

In future all control and graphics commands will be replaced by a mnemonic within square brackets. This mnemonic is not typed out or printed in the magazine but rather the corresponding key or keys on the keyboard are pressed. For example [RIGHT] means press the cursor right key, you do not type in [RIGHT]. All of the keywords, what keys to press and how they are shown on the screen are shown below.

Any character that is accessed by pressing shift and a letter will be printed as (Letter).

[SA] shift and A

[S+] shift and +

Any character that is accessed by pressing the Commodore key and a letter will be printed as (Letter).

[CA] Commodore and A

[C+] Commodore and +

[C] Commodore and C

[C+] Commodore and +

LISTINGS

If any characters are repeated the mnemonic will be followed by a number. This number is how many times you should enter the character. Any number of spaces over one will also be represented in this form.

[RIGHT 10] press cursor right 10 times

[C+80] press Commodore and + 80 times

[SFC10] Press the space bar 10 times

Any other characters should be easily recognisable for example CTRL-N means press CTRL and N and LEFT-ARROW means press the left arrow.

Any number of mnemonics can be enclosed in brackets for example

[SA10,SFC30,SA10]

means type 10 shift A's 30 spaces and another 10 shift A's.

Mnemonic	Symbol	what to press
[RIGHT]		← left/right
[LEFT]		→ shift left/right
[UP]		↑ Shift & up/down
[DOWN]		↓ up/down
[F1]		 H
[F2]		↖ shift & H
[F3]		↗ C
[F4]		↘ shift & C

Mnemonic	Symbol	what to press
[F5]		 B
[F6]		↖ shift & B
[F7]		 T
[F8]		↘ shift & T
[CLEAR]		↑ shift & CLR /HOME
[HOME]		↓ CLR /HOME
[BROWN]		 CTRL & B
[BROWN]		 CTRL & B

Mnemonic	Symbol	what to press
[BLACK]		█ CTRL & 1
[WHITE]		□ CTRL & 2
[RED]		█ CTRL & 3
[CLEAR]		↖ CTRL & 4
[PURPLE]		█ CTRL & 5
[GREEN]		↑ CTRL & 6
[BLUE]		↓ CTRL & 7
[YELLOW]		← CTRL & 8

A NEW CLASSIC

FROM PAUL WOAKES
AUTHOR OF ENCOUNTERS

YOU CHOOSE THE ACTION IN **MERCENARY**

Mercenary — a unique combination of flight simulation, adventure and arcade fun. You choose the action.

There is complete freedom of movement in a truly three-dimensional vector-graphic environment. Graphics of exceptional speed create a very realistic experience.

You'll never play the same game twice. Random elements attempt to seal your fate. Your interaction is crucial.

Mercenary presents an absorbing challenge that you will accept again and again.

MERCENARY ESCAPE FROM DARG

It's above the planet. It's a variety of craft. Investigate the multitude of adventures on the planet surface. It's your quest for external supplies. Search for mysterious subterranean complex in search of your future.

Become involved in the conspiracy involving the planet Darg and the planet Darg. It's your quest for external supplies. Search for mysterious subterranean complex in search of your future.

It's only here on the planet — the environment. It's your quest for external supplies. Search for mysterious subterranean complex in search of your future.

It's your quest for external supplies. Search for mysterious subterranean complex in search of your future.

BUSICALC 3

- the sophisticated spreadsheet !

Easy to learn, easy to use - something that can't be said of many business programs. But it's true of all the programs in the BUSICALC series.

BUSICALC 3 can handle all sorts of jobs - budgets, expenditure analysis, stock lists, price lists, and product costing are just a few of the possibilities. Three-dimensional formulae automatically access data stored on disk, so that you can easily pull together information from several different sheets and summarise or manipulate it.

It's simple to transfer data to other programs such as Easy Script. And you can use virtually any printer with BUSICALC 3, whether dot matrix or daisy wheel, Commodore or non-Commodore.

For the CBM 64 and PET/CBM 8000 & 8000 series.

Available through dealers or from:
Supersoft, Winchester House, Canning Road, Harrow HA8 7LJ
