GUIDE TO COMPUTER COMMUNICATIONS

● BOTHERSOME BASIC - BEGINNERS START HERE ● REBOUND - SUPERB C16, PLUS/4 GAME ● ADVENTURE KIT-DIY ADVENTURING

THE BARBARIAN HAS ARRIVED! THE TERRORPODS ARE COMING!

TWO GREAT NEW TITLES FROM PSYGNOSIS

BARBARIAN

Can you become the famous dragon-slaying, monster-mangling Barbarian?

Are you the warrior who conquers the fears of men of the underground world of Dungeons & Dragons? It would be terrible if you weren't!

Can you handle the adventure, the hand-to-hand attacks, the hidden traps, the gruesome death-dealing monsters? Your quest to destroy the evil of the underworld. You save the Kingdom's crown.

Your task is simple! You must find the gold and slay the evil monster. You can't win if you're killed and you're available to you. Release your own Barbarian!

Are you ready? The famous dragon-slaying, monster-mangling Barbarian? 15% colour variations available for about £7 each. Collector's design - colour monitor only.

TERRORPODS

It's been a long while... As the sun disappears over the horizon, the crawling, grey tentacles of Colan (the only survivor) following the intense heat of the day, the heat of night adds the billions of sub-zero temperatures to an already hostile environment. 100% totally unique of the 3-D, requires almost flawless.

Deep space, fully 3D, is fully updated by the still current of work. The status quo is the only one in an extraordinary world of other deep space, completely blood-free, which happens!

Horizontally, you learn to look at the corners, you learn to look at the corners of other planets before you're a proper scientist or a scientist who has happened!

Your whole being needs... it can't be too... TerrorPods 15% colour variations available for about £7 each. Collector's design - colour monitor only.

ARENA

The most sports simulation.

BRATACCAS

Beating Kyle the earth is a great moment of genetic feud.

DEEP SPACE

The ultimate interstellar war game.

15% colour variations available for about £7 each. Collector's design - colour monitor only.

- BARBARIAN £24.95
- TERRORPODS £24.95
- DEEP SPACE £28.95
- BRATACCAS £18.95
- ARENA £29.95
- ARENA BRATACCAS £28.95

FEATURES

- **Combat Simulations** 10
For those of you who want a game that packs more than a punch.
- **Bothersome Basic** 14
All you need to know about Basic.
- **Computer Communications** 18
A straightforward look at the world of communications.
- **Freeze - A Jolly Good Fellow** 23
Back-up programmes.
- **Using an Epson type Printer** 26
The combination of Easy Script with an Epson type printer.
- **Shadow Boxing** 30
How to improve your Basic Storage space.
- **Code Comfort** 38
A look at the 6802 assembler and 880 compiler for the C64.
- **Personal Choice Collection** 47
Handy home packages for the C64.
- **Arcade Action** 52
Produce your scrolling messages on screen.
- **Adventure Kit** 60
The art of adventure writing.
- **Making Music** 68
This month we look at playing tunes on your C64.
- **Link Up** 73
Connect a short-wave technical receiver and C64 to a Transceive interface.
- **Hook Ups** 82
Using the BBC as a disk drive interface.
- **Tech. Troubles** 100
Tim Arnot will guide you through the technical maze.

REGULARS

- **Data Statements** 5
- **Contributions** 24
How to write for *Your Commodore*
- **Games Reviews** 41

Star Wars

- **Pirates** 58
Game of the Month.
- **I.Q.** 65
Intellectual games playing.
- **Competition** 74
Win a trip of a lifetime on Concordo.
- **Software for Sale** 98
- **Listings** 102
How to type in your programmes.
- **Back Page** 106

GAMES AND UTILITIES

- **Sprite Grabber** 77
Use other programme's sprites for your games.
- **Rebound** 88
Program in an old fashioned favourite.
- **Hide-It** 84
Protect your Basic programmes.

THE PARALLEL DISK TURBO SYSTEM EVERY 1541 WANTS!

THE PHANTOM

NEW!

NOW WITH ADDED POWER!

DATA STATEMENTS

Electronic Arts in the UK

Electronic Arts, one of the top US entertainment software companies have announced their plans to launch a U.K. subsidiary, and are looking for new talent. 'We are looking to support U.K. software artists designing high quality software', comments Mark Lewis, Director of European publishing. 'We are in discussions with a number of software developers and are happy to talk to those who believe they can offer creativity and quality programming.'

Touchline:

Electronic Arts Ltd, Langley Business Centre, 11-49 Station Road, Langley, Av. Slough, Berkshire SL5 8JX. Tel: 0753 49442.

What Book to Buy

Following the success of the 'What' range of computer books, H & D Services have decided to go national with their second volume. A major factor in the marketing of the books is that they will be sold only through independent retailers. This provides a natural link with United Software Distribution Ltd (U.S.D.) who will be presenting the book to major independent computer retailers in the U.K.

U.S.D.'s Managing Director Andy Wood commented, 'These publications help the consumer gain more understanding of the software that they buy. The books also prolong the longevity of software and they help

solve some of the queries that haunt consumers, retailers and software houses alike.'

The 'What' range are available only from computer retailers and include 'What Now?' which is a handbook for adventurers, packed with hints, maps and solutions. Also 'What Poker' which comprises hints, maps and poker for arcade type games.

Touchline:

H & D Services, 108 Ashes Old Road, Woking, Surrey GU24 0JG. Tel: 041-170 3666.

Shades for 'Free'

All Microsoft members are now eligible for five hours free play on Shades - the multi-user adventure game. Shades (a Shades player like to be known!) can use their five hours anyway they want - in one block of five hours for one person or spread out in smaller blocks. The offer stands for all Microsoft members regardless of whether they've played before or not.

Touchline:

Microsoft, Telecity Ltd, Bunter House, 5 Market Hill, London EC1A 3EQ. Tel: 01-258 3145.

Computer MIDI in Action at Show

One of the big crowd pullers at the forthcoming PCW show will probably be Electronic Research (EMR) with their live computer-controlled music demonstration. EMR's range of computer MIDI software and hardware covers most home and business 8/16/32-bit micros and now recording, sampling and scorewriting products will be on display. The special offers will include an EMR

recording system which connects MIDI-keyboard and computer, for 999.

So follow the sound of music, and you're assured of an entertaining time, not to mention the odd bargain or two.

Touchline:

Electronic Research (EMR) Ltd, 14 Mount Close, Wickford, Essex SS11 8WQ. Tel: 0702 327747.

New Labels

Gold is a new high profile and performance software brand from U.S. Gold which claims to release six major software products between now and December. Although Gold products will formalise into retail sales, marketing and distribution policies of U.S. Gold, they will operate in the main as a separate company in terms of advertising activities and European distribution.

DATA STATEMENTS

Gold hope to link up with Captain America of Marvel Comics and Laser Tag from Worlds of Wonder, the best selling toy in the United States. Also in production is the home computer version of the blockbuster Masters of the Universe film.

U.S. Gold's Tim Chaney believes in the success of Gold and comments 'we are very confident that three years experience as brand leaders in the European software marketplace puts us in the pole position to successfully launch a new brand.'

Following the success of Barbarian, Palace have now launched a new software label - Outlaw Productions. Matthew Tims, previously general manager of Palace Software, will head the new operation, which will run alongside Palace. Matthew comments 'there are now a number of highly skilled and professional development teams in existence. Our aim is to help them produce their best work and to market it using the skills and knowledge we have picked up over the last three years.'

The first release on the new label will be a Show 'em Up Construction Kit

From left: Jonathan Hare, Matthew Tims and Christopher Tims.

for the C64. It has been developed by Jonathan Hare and Christopher Tims of Sensible Software, who with their understanding of the C64 have developed a system, which will enable a person with no programming knowledge to write the sort of games that would have cost £10.

Arctic Action

Alligata Software have released *ArcticAction!*, a game for the C64 priced at £9.95 on disk. An addictive game of shooting, scrolling, protecting, planning and humour, which demands razor sharp reflexes.

Greenies are in the final stages of completing *Greenies Copers*, which will feature the formidable Jack the Nipper. The game is set in the jungle where the tranquility is broken by the arrival of Jack, who jumps from a plane using his nappy as a parachute.

His father however is in hot pursuit, and Jack being Jack got up to mischief with a tropical flourish in his

efforts to avoid being caught and given a spanking. Jack discovers the coconuts are a useful form of defence against the natives and tries to loots tries to be as naughty as possible. A special surprise awaits Jack as he reaches 100% on the Neighbourhood, but only playing the game will reveal it!

Greenies Copers will be available for £14.99 on disk for the Commodore.

Robot! is the latest 'Gang of Five' game from Virgin. You play worker THX 1240, forced to work in an agricultural factory of the future. However, you can take no more and steal a tank from the Crowd Control Vehicle armory. Then you must escape by diverting the solar energy normally used to enhance crop growth. You need to collect and arrange solar reflectors to reflect the beam and blast your way through the levels and make your final escape. *Robot!* is available on cassette for C64/128 and costs £9.95.

Digital Integration will be launching three new titles this autumn. *F-16 Combat Pilot* is a game which

involves using a complex payload of missiles to search, locate and destroy targets. Control a variety of modern weaponry including AIM side-winder and AMRAAM missiles, AGM Maverick, laser guided bombs and Storm cannons to survive and win.

The ATF advanced tactical fighter possesses the low-flying and virtually undetectable Lookheed YF-22A. Pick up intelligence information, share a variety of targets and use your mind and dexterity in a hostile world.

With *Robotish*, choose your equipment and back-up support

Hardware Update

Now is the time for registered Commodore users to buy a colour monitor for their Amiga. Commodore Business Machines (UK) Ltd are offering £180 off either the Amiga 500 or A1081 colour monitor and £200 off the pair, through vouchers which have been mailed to all registered Commodore users. Commodore dealers have also been notified and a window sticker will signify their participation. There's no time to waste - the offer closes on September 12th.

An upgraded version of the Exelator disk drive is now available for the C64 from Evisham Mirco, who believe it is now the most compatible disk drive on the market. It is selling for £159 and following early production difficulties, it is now fully available from the foreign manufacturers.

The effects of exposure to noise in a computerised environment are often underestimated, and printers in particular should be acoustically shielded to minimise sound levels. Kawano have recently produced a Soundshield, which is aimed at the dot matrix or compact display wheel printer, which can reduce noise levels by 15 decibels. The unit is fixed with fire resistant foam and features a tinted windowed glass lid. The price ranges from £89.50 to £189.50, with additional options available such as a sheet-feeder attachment and stand and a plug-in fan.

In addition to the Amiga 500/C128 and C64, Commodore's distributors

The upgraded Exelator disk drive.

have now been given control over the PC16, PC20 and PC40/28. The distributors are Tomcor's World in Belfast and Dublin, Lightning Distribution in London, High Synthesis in Bournemouth and ZCL (Zappo) Holdings in Staffordshire. The new prices for complete systems with a mono-monitor are £699 for the PC16, £999 for the PC20 and £1199 for the PC 40/28. Tom Hart, Commodore's (UK) national sales manager believes that 'the move into the consumer marketplace with these quality engineered products dramatically strengthens the range of Commodore products available to the consumer.'

Following successful sales, Star

within constraints of sponsorship funds, and get the true feeling of speed as you compete on World Cup and Olympic tracks. All games are available for the C64.

Microtonics UK Ltd have cut prices of their two most popular dot-matrix printers. The price of the NL-10 which is a monojet printer, offering 12 characters per second (cps) in draft mode and 80 cps in near letter quality, has dropped by over ten per cent and is now available for £249 (which includes parallel interface). At the other end of the scale, the NL-15 which provides an incredible 300 cps in draft output and laser-like letter printing at 180 cps, has dropped in price to £849.

In a bid to provide a compact and effective solution to desk-top printing requirements, Vignex have produced a range of printer stands, at prices ranging from £9.95 to £29.95. The stands are ideal for use with most 80 or 136 column PC printers and allow for up to 1,000 sheets of continuous stationery to be stored underneath.

DATA

Fight to Win

Gremlin have released a war game which puts the responsibility of the future of the country in your hands. What a position to be in! In *Conroy Aetler*, war has been declared and the enemy is closing in and your mission is to patrol and defend the inner sea using all modern weapon systems which includes the SeaWolf - a deadly accurate missile, the Escort, a video-linked rocket and an anti-submarine helicopter. *Conroy Aetler* will be available for the Commodore on disk at £14.99.

Touchline

GameStar Alpha House, 10 Currier Street, Mayfield SE 1 4PE. Tel: 0742 723422.

Adventure Time

The MicroPress/Origin partnership have come up with a new concept in fantasy role-playing in *Mechanic*. Available on the Commodore disk and priced at £19.95, it comes complete with manual and oriental headband.

The aim of the game is to retrieve the Colonial Orb at Harmony which has been stolen from Mechanic. The game play is set in four different planes - each having different variables and ever-changing obstacles to overcome. At each level challenges increase, demanding greater courage and cunning, use of martial arts, coordination and the wise use of

sophisticated magic systems is essential to overcome an array of opponents ranging from tigers to assassins.

Gremlin have swapped up the computer software rights to the Charles Bronson film, *Death Wish* and have been busy adapting the film to the small screen to create *Death Wish III*. Available on the Commodore 64/128, the adventure follows the fortunes of Paul Kersey (Charles Bronson) as the justice-fighter who's out to rid New York of the punks and creeps who infest the streets. Kersey's weapons include a 415 Wileky Magnum, a pump action shotgun, a machine gun and a rocket launcher. His greatest ally in his belief that the face of innocent New York citizens is in his hands alone; the driving force behind all the violence and bloodshed is Kersey's, *Death Wish*.

Meet Captain Courageous - the latest rental from English Software. Follow his adventures through hair-raising jungle combat, journeys up treacherous rivers, dangerous deserts and lethal rockfalls, quick-fire sniper attacks, dramatic gun-fights across high level bridges and the final oceanic bid and helicopter match. *Captain Courageous* is available on the Commodore 64/128 at £9.99 for cassette and £12.99 on disk.

The PCW Show is in Town

The Personal Computer World Show is with us once more, and after ten years is still the industry's most comprehensive exhibition for business. This year's show which is being held at Olympia is being run from Wednesday 21st to Sunday 27th September, and as in previous years the first two days will be reserved for trade and business visitors. The show will open from 10am until 7pm, except on Sunday when it will close at 5pm.

Greater emphasis will be focused on the business visitor this year and the business hall in Olympia Two will boast industry experts in addition to some major product and company launches.

Other attractions will include a desktop publishing stand (DTP) which will give visitors the chance to see how

copies of the Daily Show News are produced. The editorial staff will also be at hand to offer advice and opinions of the fast growing DTP industry.

The Open University will be returning with regular video presentations on open systems in British industry and image processing, and one to one consultations will be possible between visitors.

One of the more exotic attractions at the show will be a chance to win a holiday for two in Thailand. The 14-day holiday which is worth £2,500 can be won by simply entering a draw - so make level two one of your first stops.

Tickets are available at £1 each from the Keith Prowse ticket agency (01-741 9699) or at the door.

Combat Simulations

The following games are a selection from the growing band of simulations that pack a punch, and aren't just therapy for retired pilots suffering withdrawal symptoms.

By Tony Hetherington

If your idea of simulation is pressing 43 keys to lift a plane off the ground, only to circle ground for half an hour before crashing, while attempting to land, then take a back seat to Combat Simulations puts you firmly in the thick of the action. You take command (and often the controls) of a war machine with a mission and a not just a sight seeing tour and you must wriggle first before the enemy turns you into scrap metal.

In-flight entertainment is for those who like their excitement without their feet on the ground and includes bombing raids in World War II, 800 missions for an Apache helicopter *Grounding* and futuristic fights for the *SkyFox*. Surface tension takes to the high seas and on patrol in a *Discoverer* unit finally we plunge into deep trouble and dive deep dive into submarine action.

Inflight Entertainment

Flight simulators were slow to take off with programmes that were difficult to use and won't little more than sight-seeing tours leaving the player to derive more and more spectacular ways of crashing. Flight simulators needed more action. These high fliers have plenty of action packed into dogfights and bombing raids and are as different as the aircraft they simulate.

B24

In this latest combat flyer you take control of not only one plane but a full squadron of 40 B24's in bombing raids on the oil refineries of Ploesti, Romania. Your mission is to knock out the oil supply for Hitler's war machines. The real B24 squadron that was given this task started with 80 aircraft and were left with only four after flying 70 missions. You have only 40 bombers and 79 missions to knock out 12 targets.

With a mission that's tough you're going to need some practice and so two other targets are included and so you train-as-you-bomb Montar in Yugoslavia (just over the

Adriatic Sea from your base in Spiezofola, Italy) and the heavily guarded Romanian city of Bucharest. Survive these training missions with your squadron in tact and you're ready for the main event.

To help you plan your assault the game disk or tape is accompanied by a map of your targets and possible routes, an intelligence report on Ploesti and an instruction booklet that includes a step by step guide through the Montar mission.

The first step of a mission is to take off and circle at about 20000 as the other planes slip into formation. Then you must rendezvous with your fighter escort, proceed to the target and start your bombing run. The effectiveness of your run is increased if you're flying at the correct height and speed, hit your bomb load and deliver it on the target. Once you've done this you should get out of the area as quickly as possible and get your squadron back to base with as many planes as possible fit and fueled for the next mission.

B24 is one of SST's superb strategy games and despite its crude graphics, it's a frantic game to play. It was designed by two former pilots, so you can be sure it's accurate, and you can speed up real time to fly past the long flights to and from

the target. The game assumes that Squadron Leaders know how to fly a plane and leave you with minimal controls but plenty to do as you plan relentless assaults with fighter escorts, bomb targets and return to base while coping with damage to your own aircraft. One mission down, 16 to go and you're already lost four aircraft and another six need repair!

Touchline

Title: *2/3* **Supplier:** US Gold/SSI, Dist: 2/3, Heddon Way, Redford, Birmingham B5 7AJ, Tel: 021-356-2388, **Machine:** C64, **Price:** £19.95 GB, £14.95 (c), **Originality:** 5/10, **Graphics:** 4/10, **Playability:** 7/10, **Value:** 7/10.

Garship

A former Game of the Month (May '87) Garship took flight simulators to new heights and its players on 180 missions that range from the training field of the USA to the battlefields of the world.

The Apache helicopter garship is remarkably easy to fly considering there are 31 keyboard and joystick controls thanks to a keyboard overlay and two 'fly and fight' three' controls.

When you've graduated from the training fields you're ready for your first sortie in South East Asia. After an intelligence report and mission details of your primary and secondary targets you must arm your Apache with a balance of 30mm cannon rounds, Hellfire missiles, Flar rockets and Sidewinder air to air missiles. The exact nature of your weapons is decided by the mission you're on and the enemy forces that you're expecting. Cannon fire is good at close range but you'll also need some Flar rockets to take out infantry and gun emplacements where as Hellfire missiles are needed for armoured targets such as tanks and bunkers leaving the Sidewinder to great enemy blind helicopters.

As you travel the globe from Asia to the Middle East, Central America and Europe you'll be challenged by more powerful and better equipped enemies and will need all your electronic counter measures, flares and chaffs to stay in the air long enough to complete your mission.

Successful missions will earn you points, medals and even promotions until eventually you'll retire as a heavily decorated Colonel.

Garship is a massive 180 missions, 3D flight simulator

where the sky is the limit for the pilot skilled in combat flying.

Touchline

Title: *Garship* **Supplier:** Microspace, 2 Market Place, Fribury, Gloucestershire GL2 8JH, Tel: 0606 34378, **Machine:** C64, **Price:** £39.95 GB, £14.95 (c), **Originality:** 8/10, **Graphics:** 8/10, **Playability:** 10/10, **Value:** 10/10.

Acas of Acas

The Mosquito fighter bomber flew a variety of missions during World War II and now it's your turn to take the controls as you try to become the Ace of Acas.

The game begins in the briefing room as the C.O. outlines the tasks ahead to destroy the U-boats as they leave their base, shoot down incoming bombers, deflect V-1 rockets and destroy a POW train but not the cars containing the prisoners. These missions can be tackled individually but to become the Ace of Acas you will have to tackle them all in a single sortie.

To fly the mission, you will have to master the controls on five screens that show your left and right wings and engine, bomb bay and weapon selector, operations map and forward view from which you must fly the plane and shoot down enemy aircraft.

Ace of Acas owes a lot to an earlier Archer game based on the Dambusters but features more options, missions and a lot more action.

Touchline

Title: *Ace of Acas* **Supplier:** US Gold (direct), 4/1st 2/3 Heddon Way, Heddon Birmingham B5 7AJ, Tel: 021-356-2388, **Machine:** C64, **Price:** £9.95, **Originality:** 7/10, **Graphics:** 7/10, **Playability:** 8/10, **Value:** 8/10.

Skyfox

Skyfox is an all action 3D combat flight simulator set in the near future where you must battle an alien invasion force of tanks, planes and mechs. The scenario starts from training missions to all out scenarios that have descriptive names such as the Atlanta, Massive Overflight and Corridor.

The screen display shows the cockpit of your Skyfox Phantom showing the radar scanner to plot the position of

the enemy, shield, fuel and speed indicators as well as your view of the battlefield. You can punch up a computer screen which will plot your position as well as those of the enemy tanks, planes and submarines. Your first target must be the motherhips as these can launch squadrons of tanks to destroy your installations. Lose these and you lose your chance to retreat and rearm. You can then choose whether to take on the tanks at ground level or zoom up above the cloud cover to dogfight with the enemy aircraft.

A great game which was one of Activision's greatest hits and could get a new lease of life as Electronic Arts set up a UK base.

Tankline

Title: *Tankline*. **Supplier:** Electronic Arts, *Amiga Business Centre*, 21-25 Station Road, Langley, Nr Slough, Berks SL1 2JF 8YB. **Tel:** (0753) 49442. **Machine:** C64. **Originality:** 5/10. **Graphics:** 8/10. **Playability:** 9/10. **Value:** 8/10.

Here's a dash of destroyer action in which you must protect the fog world from air, sea and underwater attack in *Convoy Raider* and Captain your ship in seven different Destroyer missions ranging from a Subhunt to *Convoy Escort*.

Convoy Raider

In *Granada's Convoy Raider* your mission is to guard the Inland Sea and attack and destroy any enemy planes, ships or aircraft that you find. Finding them isn't a problem as they'll find you even if you don't leave your post. Surviving is the skill.

The action is controlled from five screens that are accessed from a radar screen with three sweeping radar displays showing the presence of any enemy in the sky, on the surface or underwater. A display shows up on any of these you must go the appropriate battleship. You must man the anti-aircraft sea wolf missile to shoot down enemy planes or incoming Dacon missiles, the depth charge helicopters to destroy submarines and guide your own Escorts to knock out enemy shipping. You must plot your movements around the Inland Sea using the map screen and assess the state of your ship from the damage screen.

The action is fast and furious but isn't quite up to the standards of the other simulations.

Destroyer

Title: *Convoy Raider*. **Supplier:** Granada Graphics, Alpha House, 30 Corner Street, Slough SL1 4FS. **Tel:** (0753) 731422. **Machine:** C64. **Price:** £8.99/£6. **ETA:** 89/90. **Originality:** 3/10. **Graphics:** 3/10. **Playability:** 7/10. **Value:** 5/10.

Can you man 12 stations on a Fletcher class Destroyer, all at the same time? Can you also use these stations to complete one of seven missions on the high sea? You will need to do a bit this and more as you take the helm in *Epyx's Destroyer* as well as the radar, sensor, navigation, bridge, observation deck, forward and aft guns, port and starboard anti-aircraft guns, port and starboard torpedo tubes, depth charge and damage control stations? You move between the stations by typing in two-letter codes such as BR for bridge and after a few seconds you're faced with a new set of controls. Most controls are self-explanatory such as aiming guns or torpedoes before firing or setting the depth charges to a bracket of depths for a better chance of taking out a submarine.

In the controlled panic of a full mission you will need all your skill and strategy to ensure that you get your shot in first, and that is comes as you can't afford long battles with a single enemy ship when you've got a convoy to protect and damage control crews to assign, a course to plot and so on. An excellent multi-screen simulation.

Tankline

Title: *Destroyer*. **Supplier:** US Gold/Epyx, Unit 2/3 Midland Way, Mottspur, Birmingham B6 7AL. **Tel:** 021-556 1588. **Machine:** C64. **Price:** £9.95. **Originality:** 7/10. **Graphics:** 9/10. **Playability:** 9/10. **Value:** 9/10.

The sleekness of a submarine as it lurks unseen underwater only to surface and strike at the heart of a convoy has always been great material for a game. Until now, C64 submarine games could only sign up for the Silent Service. Now they can also go on patrol in *My Periscope* and will soon be able to shoot direct dial with the submarine version of *Epyx's Destroyer*.

Up Periscope

Home-based Activision have produced one of the best

simulations you're ever likely to play as you take to the depths in a World War II fleet class submarine.

The screen display is split into three sections. A strip across the top of the screen shows the command options available and highlights those selected. Below that a 3D view displays what you can see from either the conning tower or the periscope and below that is an instrument panel showing your bearing, depth, speed, power, torpedos left and every other dial or reading you'll need to find your targets and sink them.

If you select the charts to plot your position on the radar to search for enemy destroyers or perhaps the torpedo data computer to lock on targets then the 3D view will swap to a split-screen display with the instrument occupying the right hand side and the important part of the 3D view on the left. The result works extremely well either in a practice mode or on patrol in the Pacific.

The graphics are quite exceptional and are the result of *ActionBall* using Sublogos 3D routines pioneered in its flight simulator.

A copy of this game arrived in the *Four Commodore* office in an unmarked pack and it took some time to track down where you could get it. There isn't a UK version of it yet so if you want a copy of the game disk, instruction book and tactics manual you'll have to get an imported copy from Strategic Plus Software.

Facilities:

Title: *Up Periscope*. Supplier: *Action Soft/Strategic Plus Software*, P.O. Box 8, Hampton, Middlesex TW9 2JG. Tel: 01-879 2887. Machine: C64. Price: £30.

Silent Service

Silent Service was the first submarine simulation to reach these shores courtesy of US Gold.

Once the game has loaded and the scenario selected, the program displays the bridge with you standing by the periscope. If you press the buttons you can see through the scope (if you're not below periscope depth) but you can also move the joystick to go up to the conning tower to fire the deck gun, to the map table to plot a course and to the instruments to change course. Once selected the screen changes to show the relevant display.

As in *Up Periscope* you can put your submarine skills to the test in a series of scenarios and war pat roles in which your targets will be tankers and troop ships and your enemy the

destroyers. To add to your problems you can include a selection of reality factors such as poor visibility, snagging conveyors, dead torpedos and the worrying expert destroyers.

Silent Service is the easiest submarine game to play but *Up Periscope* will provide a better campaign game. You may even get promoted.

Facilities:

Title: *Silent Service*. Supplier: *Microprose*, 2 Market Place, Fribury, Glosoucestershire, GL8 5SA. Tel: 0666 34326. Machine: C64. Price: £9.95.

Displaying: 3/70. Graphics: 8/70. Playability: 8/70. Value: 8/70.

THE MPS803 PRINTKIT IV

ATLAST
top-quality performance
from your MPS803 printer. Simply fit PRINTKIT IV
for:

- TRUE DESCENDERS on your original character set
- an attractive alternative (D)A/C character set
- an emphasised BOLD option

Bothersome Basic

Given up on Basic or never got started? It does have its uses - and it is worth having a second go, so follow this series. . .

By Eric Doyle

Essential Attitude

For several years now, Basic has been created, struggled with and ultimately ignored by countless thousands of would-be programmers. The main problem is that there are very few training courses specifically aimed at the Commodore 64 home user. I was myself involved with an enterprise aimed at bringing Basic to the masses through intensive weekend courses. One message was clear, it is not easy to learn from manuals alone and most people require clear concise instruction to help them understand the why's and wherefore's of specific programming problems.

Having just alerted the Editor to the apparent futility of this series I'd better quickly explain my Basic philosophy!

This series will deal with all aspects of Basic for the beginner, the creation and the persistent keyboard buster. If you find you don't understand any area that we cover during future months, pick up your pen and write to me. If a routine in one of your programs refuses to respond to gentle persuasion, let me know. Before I disappear under a flood of white envelopes I will say now that I can't promise to have enough hours in a week to answer all of your individual problems but I do promise to give all the help I can but only if you follow the instructions at the end of this article.

Each month the article will deal with a simple programming technique followed by a deeper dive into the workings of the computer which may be too advanced for those just wishing to write some useful routines, but which will provide the key to a fuller understanding of computers for those who wish to progress to machine code routines later on.

A good attitude to take towards your computer is to think of it as a foreigner with a limited command of English. The first reaction a confused tourist will experience is the natural assumption that they've as thick as two short plants and as deaf as a post. In most cases this is not really a fair attitude but with a computer nothing could be nearer the truth. If you don't believe me think of all the times the machine has refused to perform the simplest of tasks without fault and consider why we have to use CAPITAL LETTERS!

Presumably you will all have read the creative and definitive training given in the Commodore manual and, despite this handicap, have nevertheless glanced a few of the very basic commands available to you. I will assume that you can now successfully PRINT messages on the screen and that you will also have noted the fact that programs consist of numbered lines of instructions which the computer slavishly reads and obeys unquestioningly. A simple program would look like this:

```
10 PRINT "DON'T PANK"
```

Type RUN and the words DON'T PANK appear on the screen. All very comforting but not exactly useful.

We can get the computer to do something fractionally more thrilling by using a device known as a loop. This causes the program to repeatedly repeat the program over and over again. The simplest way to do this is to add the line:

```
20 RUN
```

All this does is to get the program to re-run time and again and, despite the comforting message, it will induce extreme panic in the beginner when the worried machine refuses to stop. Don't reach for the power switch, simply press the key marked RUN/STOP on the extreme left of the keyboard and the computer will take a break until you type in RUN again.

Believe it or not, one of the most common faults at this level of programming is to forget to press the RETURN key when typing in the program. If your computer isn't behaving properly type LIST (remember to press RETURN) and the contents of the program memory will be repeated.

Now that you're fully equipped with a way to drive computers to hell and up the wall with eternally repeating text messages at your local computer store let me say that he will not be impressed with your programming style! Far better to substitute line 20 with:

```
20 GOTO 10
```

This simply tells the computer to loop back and repeat line 10 ad infinitum or until the RUN/STOP key is pressed.

Once again we have produced a program with very little practical application except for hi-tech vandals who make the salesman's life a misery of continual vigilance.

To Usefully Go (To)

Before we see how the GOTO command can be used in a sensible way, we have one more kind of loop to consider which introduces a basic concept used by all programs: the variable.

Type **NEW**, press **RETURN** and you will clear the computer's memory ready for a new program. If you try **LIST** at this point the computer will simply respond with the word **READY** so type the following program in:

```
10 FOR A=1 TO 10
20 PRINT "DON'T PANIC"
30 NEXT A
40 PRINT "FINISHED"
```

Run the program and you will find the phrase printed just ten times on the screen. To explain this miraculous phenomenon concentrate on line 10.

The letter **A** is known as a variable. The best way to imagine this is to think of the computer as a stack of boxes. We have asked the computer to mark one of these boxes with a big letter **A** in which it will store anything we say that **A** is equal to. You may now think that we've told the computer that **A=1** but what about the **TO 10** bit? The main thing about a variable is that it can be varied! We've told the computer that **A** will vary between 1 and 10. The computer translates this as meaning that **A** will have a value of one at the beginning of the program so it stores that value in the box labelled **A**.

The program then runs to line 20 and prints the message. Then when line 30 is translated the computer checks back to where **A=1 TO 10** was encountered and loops back to that line. Now the clever part occurs. Checking the contents of box **A** the computer finds that it still contains a one. Having been told that **A** will vary between 1 and 10 it increases the content of the box by one so that **A** now contains the value two. Line 20 is obeyed and **NEXT A** is encountered again so it loops back to line 10. Once more the content of box **A** is increased by one to three and the whole process is repeated until **A** has a value of ten.

When **A** is increased the computer checks to see if that number is greater than ten. We have now reached the point where **A=10** and is incremented to eleven this is bigger than ten and so the program jumps to the line after the **NEXT A** command and **FINISHED** is printed on the screen.

How can we prove that this happens? First of all type **PRINT A** and press **RETURN**. The value eleven is printed on the screen. Hmm, it seems plausible but we need proof.

Small Differences

Let's try something different. **LIST 20**, move the cursor to the end of line 20 and type in a semi-colon. Press return and **LIST** the program. Mysteriously, the computer should have inserted the altered line in its correct place in the program:

```
10 FOR A=1 TO 10
20 PRINT "DON'T PANIC";
30 NEXT A
40PRINT "FINISHED"
```

Change line 40 to read **PRINT A** and run the program. This time the message is printed ten times across the screen with 11 printed at the end. The semi-colon tells the computer that the next **PRINT** statement will continue from where the last print statement leaves off. Alter line 40 to:

```
40 PRINTA;PRINT"FINISHED"
```

Return and you'll see that the number 11 is now printed on a separate line. We have ended the semi-colon dictionary again. As you can see more than one command can be written on a program line as long as you separate the commands by a colon. **NEW** the program and type this in:

```
10 FOR A=1 TO 10PRINT A;
"DON'T PANIC";NEXT A;A
```

Don't worry about the question mark in line 10, just type in the line as printed here and run the new program.

This time the messages are preceded by a number which is the current value of **A**. List the program and you'll find that the question mark has changed to the word **PRINT**. The computer has a built-in shorthand

Command	Abbreviation		
ABS	ab	NEXT	ne
AND	an	NOT	no
ASC	as	ON	on
ATN	at	OPEN	op
CHR\$	ch	OR	or
CLOSE	cl	PEEK	pe

LIST	li	USR	us
LOAD	lo	VAL	va
LOG	lo	VERIFY	ve
MOD	mo	WAIT	wa
NEW	new		

which can save space and time. You may have recognized listings which have lines that the computer refuses to accept because they stretch beyond two lines of text on the screen. This is known as the logical line length which, logically, is the maximum length of a line and equals 80 characters or in other words two screen lines.

We'll come back to this later so save it as the back of your mind in a box marked "Don't Forget".

Nine Times?

Let's put our loop to some serious work. A computer is more than a sophisticated adding machine but it can be used to best effect for calculations. Let's construct a program which produces the nine times table. We could do this in the long winded way which would repeat lines such as:

```
10PRINT 2 * 9 = "2*9
20"3 * 9 = "3*9
and so on, but using a loop simplifies all this typing:
30 FOR A=2 TO 12
40 1A * 9 = "A*9
50 NEXT
```

You'll notice that I've failed to type A after NEXT in line 50, preferring to let the computer decide which variable we're currently using. This variable's name is not particularly helpful when you come back to look at the listing in two years time so why not use the computer's ability to understand longer variable names. It could easily be called NUMBER instead of A, but you must change the name in each line where it appears.

We can run two loops at the same time by placing one inside the other:

```
10 FOR MULTIPLIER=2 TO 12
20 FOR NUMBER=2 TO 12
30 NUMBER=" * "MULTIPLIER
40 NUMBER * MULTIPLIER
50 NEXT NUMBER
```

Running this program causes the computer to put up the full set of tables from two to 12 but it all goes too quickly for any practical purpose.

You'll also notice that I've only used the first two letters of each variable name in the NEXT statements. The name of a variable is a bit of a con because the computer only

labels the relevant bytes with the first two letters of the variable's name. When naming variables you must always remember this because the computer would treat variables called MULTIPLIER and MULTIPLE*AND as the single variable MU and chaos would result.

Loops Within Loops

You'll also have seen that I've gone back to naming the variables after the NEXT statements. When more than one variable is used it's safer to do things this way but make sure that the variables are named in the correct order. The computer will not accept loops which are not properly 'nested' inside one another. In other words the following is acceptable:

```
10 FOR A=1 TO 10
20 FOR B=1 TO 5
```

```
30
40
50 NEXT B,A
```

But in the following, the loops are not nested loops and would cause problems:

```
10 FOR A=1 TO 10
20 FOR B=1 TO 5
```

```
30
40
50 NEXT A,B
```

Meanwhile, back in our program there is one way to make it easier to see the times tables by adding the following line:

```
40 NEXT NU
50 FOR DELAY=1 TO 25:NEXT
60 NEXT MU
```

Now the program pauses between each table printed. Line 60 simply makes the computer count to 25 before continuing. Try varying the value and see what happens.

Keep Your Short-hand

Before I pull the plug on this week's beginner's course let's go back to the computer shorthand.

Apart from the question mark for PRINT, most of the other keywords can be shortened by using the first one or two letters of the keyword followed by the next letter Shifted. The best way to see this is to watch the computer into lower case mode by holding down

the Shift key and pressing the Commodore key once.

Type in the following:

```
10?@Q@ll@r@r@T
```

List the program and you'll find the keywords revealed in full. A full list of abbreviations can be found near the back of your Commodore manual but I included it here to show the number of command keywords at your service.

The Deep End

The following line extends beyond the logical line on the screen. Try entering it as printed here and see what happens when you press RETURN:

```
10PRINT "THIS WOULD NOT
FIT INTO ONE PROGRAM LINE";
FOR A=10 TO 10:FOR B=1024:A,B;
NEXT:B=11"
```

Next switch to lower case and enter the line as follows:

```
10 "this would not fit into one
program line";
FOR A=10 TO 10:FOR B=1024:A,
B;NEXT:B=11"
```

This time the line goes into memory. List it and it does the impossible by stretching over three screen lines. Why?

To understand this phenomenon you have to realize that every character in a program line is stored as a separate number in consecutive memory locations. Keywords are stored as a single number no matter how long their real name is. PRINT is stored in memory as the value 123 but is a statement such as:

```
PRINT "PRINT YOUR NAME"
```

the first PRINT would be stored as a single byte of value 123 but the second PRINT in the question marks would be stored as a string of ASCII codes for the relevant letters: 80,82,73,78 and 84. If it were possible to poke a line directly into memory you could loadily enter almost 40 keywords on one line!

Send your problems to Eric Doyle, *Bullseye Basic*, Four Commodore, 45P Ltd, 1 Golden Square, Canton H18 1AB (excluding any delivery payments or linking knowledge relating to your query. I'm afraid that I cannot answer queries by phone under any circumstances.

Mini Office II

6 powerful home and business programs in just **ONE** package – at a price that simply can't be matched!

Outstanding value for money... If you want to use your 64 as a highly efficient office machine, Mini Office certainly gives you the power you need.

Computer Communications

Communicating with computers is very fashionable at the moment, but can also seem very confusing to the novice. We take an in-depth look at what communications are and why they are needed.

By Jennifer Goldsmith

While all know and understand what is meant by human communications, but computer communications are different, or are they? They are different because a computer is a machine which cannot think, but which is programmable and more importantly we can get to the inside of a computer whereas we cannot connect a lead from one person's brain to another! A computer and a person are similar in the way that data (ideas

or words) is sent from one machine and received and interpreted by another. That's fine, you may say, but why do two computers want to communicate?

The answer is simple, we want them to. We want and need the information which is only available through them. In a large company, perhaps using different systems, information may need to be transferred from one computer to

another within the same building, so a phone line is not necessary but a fast rate of transfer (fast rate - explained later).

On the other hand, to transfer data between different offices or between your home and a computer makes a way necessitates the use of a telephone line (except in a specialised field where data is transmitted via satellite). A telephone line limits the rate of transfer which can take place.

Connecting Your Computer to the Phone Line

In order to connect your computer to the phone line, there are two essential items you need.

First of all, your phone line must have the 660 Jack type sockets. These sockets allow you to plug in your phone, answering machine or modem providing of course, that the peripheral, i.e. your phone or item that you wish to plug in, is fitted with a like white plug.

Secondly you need a modem. The word modem is an abbreviation of the words Modulator/DEModulator. The signals a computer understands are not the same as those which go along a telephone line and therefore a modulation process is necessary at both the sending and receiving ends. This modulation process is carried out by the modem.

After the software used depends on the modem you use and the purpose for which it is to be put. Some modems come with software either in them (in ROM) or on disk with them, others require you to purchase the software separately.

Which Modem?

Before this question can be answered, you have to decide what services you want to access with your computer, in other words you have to decide what you want to do once you have it connected up. It's rather like buying any other software; you have to think what features that software should have, which will be dependent on what you want to do.

Which Features?

The first thing to consider when deciding on which modem to use, is baud rate. Baud rate is the rate at which data transfer occurs and is measured in bits per second (bps). (Remember that a single character is made up of eight bits or one byte, at least as far as eight bit machines are concerned.)

However, when characters are sent from one machine to another, additional signals are needed to indicate to the receiving computer, i.e. 'end of character'.

Therefore, as a rule of thumb, when converting from baud rate to

characters a second, you should divide by ten. Thus a baud rate of 300 is equivalent to 30 characters per second. Also the maximum baud rate which most telephone lines can use in this country is 1200 bps.

The common baud rates used in Britain over the telephone line are 300/300, 1200/75 and 1200/1200.

When baud rates are written, the downloading or receiving rate is written first and the uploading or sending rate is written second. In two out of three cases the rates in both directions are the same.

The baud rate 1200/75 is very popular in Britain, although most used in America enables information to be received at 1200 bps, yet sends information at only 75 bps. The baud rate 300/300 is used for Telecom Gold, Packet Switch Stream (PSS) and bulletin boards both in this country and the USA.

The baud rate 1200/1200 is used mainly for user-to-user file transfers and fast upload by editors on Prestel and Compuserf. This is also used in the USA. Companies such as Prestel, Compuserf, Telecom Gold, PSS and bulletin boards favour 1200/75.

What Update

Without going into too much detail at this stage, I'll briefly explain some words that I've used.

Prestel is a service run by British Telecom, yet its information comes from various firms, organisations and hobbyists.

Compuserf is a service run by Compuserf Telecommunications Ltd and is specifically for 16 and 128 users at the moment.

Packet Switch Stream is a service run by British Telecom (in this country) which allows you to access computer systems in other countries, e.g. USA, Europe, etc. which use different communications protocols, i.e. have different parameters, to our own.

Telecom Gold is another service run by British Telecom.

Bulletin Boards are services provided by private individuals or companies for people with similar interests, e.g. a catalogue of a company's products, or a particular hobby such as amateur radio or Commodore pets.

Interfacing the Modem to the Computer

When deciding which modem is needed, the first part to consider is how to interface the modem to the computer. The two main interface standards used are a interfacing to the cartridge port and by interfacing with the RS232 (usually via the user ports). This can be an important point to consider, e.g. if you plug a modem or cartridge into the cartridge port of the 128 it will power up as a 64. Also some software will not let you print out via the user port if the modem is plugged into the cartridge port, but this is much more of a software problem.

Modems from Tandata

Tandata Marketing Ltd have produced various modems which use a serial interface from the TM110 which could be used with the VC20, 64 and 128 at a cost of 59 compared with the TM121 which costs £39. Tandata's modems usually allow all the combinations of baud rate with both full and half duplex along with other facilities, like being able to store your phone numbers and passwords. This means that in order to log onto a system you simply press a couple of keys and the modem automatically dials the appropriate number and logs you on - very convenient, as long as the modem does not fall into the wrong hands!

Modems from Miracle Tech.

The 64 Multi-modem is a product from Miracle Technology but it cannot be used with other micros. On the other hand the WS2000, WS3000 and WS4000 are very versatile BS212 modems. The WS4000 costs £159 and has many features - as they all do. On the other hand the WS2000 costs only 599 and is still available. The WS3000 comes in various versions costing from about £200 upwards! They all come with the necessary software to drive both Prestel and Telecom Gold (terminal/emulating software). There are various versions of these modems including some expensive ones, which have useful features like detecting the baud rate of the host machine and setting itself accordingly.

Connecting to a Service

Before powering up your computer, make sure that your modem is in place and correctly connected to your computer. Never connect or disconnect your modem once you have switched on the computer. Always switch off first. If you do not, you can blow some of the chips inside the computer. Once everything is physically in place, dial the computer you want to communicate with. If your manual indicates then just follow the manual's instructions and type in the appropriate phone number. If your modem does not answer, then you have to make sure that your phone is either plugged into your modem or into the same Jack as your modem

depending on which type of modem you have. Once you have dialed the computer and it has answered, you will hear a high pitch whistle. You then connect the modem by pressing a button or a switch.

Which Service?

So far we have said that you have to decide on what you want your software to do before obtaining your modem. To do that you have had to decide which computer you will want to access. We will now take a brief look at the main systems in Britain, namely Prestel, CompuNet and Telecom Gold.

Prestel

This is British Telecom's videotex system. It is in colour with graphics and a scrollfull of data is displayed at a time. A screen of data is 22 columns high and 40 columns wide. Although British Telecom own the computers which store the information, the information is provided by various Information Providers (IPs). The IPs are numerous and vary immensely from the A.A.A. to the Zimbabwe Tourist Board. There are over 300,000 pages of information on almost every subject including Agriculture, Education, Banking, Microcomputing, Hobbies, Travel and Teleshopping.

Some of the IPs use Prestel as a gateway to their own computers, i.e. Prestel automatically connects you via a phone link to another computer. On Prestel there is the facility to receive and send mailboxes, receive and send telexes, to download software and to purchase certain items using your credit cards. You can even now use Prestel to access Telecom Gold! Prestel is not just a factual encyclopedia; there are also many games available (including multi-user games) quizzes and competitions.

Prestel is also cheap, 99p of all people in the UK have local call access. Even if you are abroad you can use PPS to access it. Computer connect time is only charged from Sun to Tues Mondays to Fridays. At all other times it is free. Most pages are also provided free but some are charged for (city finance pages) but you are always notified in advance. The only other charge which you will come across, besides the Prestel subscription of 10p per quarter is the charge for various closed user groups (CUGs). Some CUGs are free, others are very expensive. The Prestel Microcom-

puting CUG is only 10p per quarter and this gives you access to literally thousands of pages. So for £10.00 per quarter, you have access to a magazine which is updated frequently and which consists of thousands of pages. Some interesting areas are also in the Prestel Microcomputing CUG even though they are not exactly Microcomputing, such as Amateur Radio in the Chalfont area.

Micronet

The Prestel Microcomputing CUG is owned by a company called Micronet. Micronet is the biggest IP on Prestel which explains why they can produce so many lovely things. The advantage for newcomers who have not yet purchased a modem, is packages. These packages, usually 699wa though 529 for the Amiga! include a modem and software for accessing Prestel plus a year's subscription to Micronet and Prestel (which is worth 694). So for £29 you get a modem and software. These packages exist for the Commodore 64, 128, +4, Amiga and PC as well as for other micros.

CompuNet

As I've said before, only the CDM modem can be used to access this system. A subscription to CompuNet can cost anything from 59 to £15 a quarter, depending on the type of account required. There are connect time charges but some of these can be dispensed with if you have a GDD account (£15 per quarter). If you take out a quarter's Gold subscription plus post and packing of £3.50, a modem will be provided free of charge!

There is not local call access for everyone. So why use CompuNet? CompuNet does provide facilities that Prestel does not, e.g. you can buy items and have them charged to your CompuNet account (which is something Prestel does not do). CompuNet also has various IPs but not nearly so many as Prestel, but the information on the system is all geared to 64/128 users, but is not only to do with Microcomputing - there is also a hobbies section. Unlike Prestel where viewers cannot add or upload pages unless they have access to the editing computer, CompuNet users can upload pages into an area called the Jungle and without the need to use a

separate computer.

Compuart also has a useful editor which can be used both online and offline. It has many facilities and it is the way you print pages from Compuart. Compuart also has a stack-based menu, so when you want to go into the editor for example, you move the cursor until it gets to editor and then press return. Pencil on the other hand is mainly operated by numbers which originates from the days when most terminals were not alphanumeric. Pencil has recently begun to use words called keywords, so instead of *R0070 you can try *R04000 or *ICPU000. The main disadvantage with Compuart is that it is slow, but improvements are being in the system to speed it up.

Telecom Gold

This is a scrolling system in black and white. It is ideal for sending and receiving long documents or for searching special databases which are

expensive (£1 a minute). Telexes are fairly cheap on Telecom Gold. There are, however, connect charges at all times and these are expensive when compared with Pencil or Compuart. For example after 7pm in the evening, Telecom Gold's connect charges are three pence a minute. Pencil is free and Compuart is about 40 pence an hour (a penny a minute). However, no-one remains on Telecom Gold for long, it is not meant to be a system which you browse around, although various items of useful information and facilities are provided. Like Pencil it can be accessed by PSS.

Bulletin Boards vary considerably and either use scrolling or view data compatible software. One of the well-known viewdata compatible BBS is Database. BSGIB's bulletin board for Amstruc Radio Hobbyists (Tel 0202 52242). Like most Bulletin Boards telephone lines are available which means that you may find it hard to get on to the system at popular times and of course the software can fall over!

AMAZING NEW "TOTAL BACKUP" CARTRIDGE FOR COMMODORE 64 AND 128 (IN 64 MODE)

NEW ACTION REPLAY V.3 FROM DOSOFT

UNSTOPPABLE "TOTAL BACKUP" CARTRIDGE

OUR NEW INNOVATIVE HARDWARE AND SOFTWARE COMBINATION GIVES YOU MORE POWER, MORE FEATURES, MORE FUN!

MEGA-FREEZE
Simply freeze your disk to prevent any further damage. This feature is useful for protecting your data from accidental deletion or damage.

SPRINT CONTROL
Control the speed of your disk operations to prevent overheating and extend the life of your disk.

PICTURE VIEW
View your disk data in a graphical format, making it easier to identify files and folders.

DISK PASSWORD
Protect your data with a password, ensuring only authorized users can access it.

CODE INSPECTOR
Check for errors in your code, helping you catch bugs before they cause problems.

COMPATIBLE
Works with all Commodore 64 and 128 systems, ensuring you can use it on any machine.

DiskMate Cartridge V.2

**TOP-UP SUCCESS!
WE ASK WHO'S
KIDDING WHO!**

\$14.99

Super Software Sale
From 10.99 and 14.99 to 9.99 only!

SO EASY TO USE
Simple to use and easy to learn, making it accessible to users of all skill levels.

FAST DISK UTILITIES • **LOADERS** • **2-MIN DISK COPY** • **FAST DISK FILE COPY** • **FAST FORMAT**

Freeze - A Jolly Good Fellow?

Freeze Machine is a combination of two of Evosham Micros utility programmes encapsulated within a single cartridge. Bringing together Freeze Frame MkV and Laser MCH enables you to back up your programmes in a form which will reload in seconds rather than minutes.

By Eric Doyle

Freeze Frame is designed to produce backups of any program that you own, including commercial programmes. This obviously raises the question of copyright and piracy for that as I prefer to call it. Evosham Micros are well within their legal rights to produce utilities such as this and would say publicly that they do not condone program theft. By stamping the legend **STRICTLY FOR PERSONAL USE** across their instruction booklet, they absolve themselves of any claim which the purchasers of the cartridge may put it to. The mission of the cartridge is the thief.

It's a bit like buying a gun. The purchaser is bound by the law not to fire the weapon in such a way as to cause personal injury to someone. That doesn't mean that shootings don't occur and when one does the legal process swings into action against the user, not the manufacturer. This analogy holds out quite well, but I feel I must point out that there is no such thing as Law as accidental copying!

To own a backup you should also have the original program, if you don't then how can you plead innocence? If you steal a program then it is not just the company producing that package that suffers but the programmer. Now, I am sure it is no way condones the theft of games but we cannot ignore the fact that fast backup copies are best practice.

As a journalist the main application for my home system is for word processing. I favour the Superscript package but it takes 2 minutes 24 sec to set it up the way I want it. Not a long time, but it's over two minutes of not earning cash! Could a fast load help me out? Yes, with Freeze Machine it takes about 20 seconds using the Laser loader and 50 seconds without it. Over a year this could increase my take-home pay by over £180, more than enough to cover the cost of the cartridge, plus there are all the other programmes I use ready to be backed up.

"It's handy to be able to save and load all my development programmes at high speed and this is possible with Laser"

The Laser cartridge has two most buttons, one brings in the Freeze facility and the other toggles between the fastload and laserload menus.

In truth I was not convinced that Laser was necessary for two reasons. Firstly, the fastload facility was not significantly slower than Laser but secondly, and far more importantly, the Laser program file is stored as a locked USH file. This means that either the cartridge or a 'host' program is necessary to load it and it always loads at turbo speed. The effect of this is that when your disk drive becomes slightly misaligned or varies in speed later in its

life, all of your USH files will be useless until your drive is repaired. This can be a nuisance.

Turbo loaders are far more sensitive to speed variation than is the standard loading system. So a system which offers both alternatives is the best and hence system for me. This means the fastloader in the Laser cartridge.

Of course, backing up commercial programmes is just one use of the cartridge. For a programmer like myself it's handy to be able to save and load all my development programmes at high speed and this is possible with Laser. I can also load-format disks and use the DOS system to scratch and validate files. The only thing I miss is a built-in monitor which would be useful. I'm afraid because I must admit to being the proud owner of Evosham Micros' miraculous Dolphin DOS system which makes Laser look slow. Evosham claim a speed increase of over 20 times with Laser but my tests using a standard C64 came nowhere near to this.

Inside the Laser cartridge there is a very powerful utility set for your C64. It won't work with every piece of commercial software on the market but a large proportion of them can be backed up. At £28.95 it's a steal!

FinalMic

Evosham Micros: 85 Bridge Street, Evosham, Worce HRE11 4SE. Tel: (0190) 381980.

Contributions

*So you own a Commodore? So you've
written some programs? So why haven't you
sent them to us?*

Your Commodore is always on the look out for new programs, items and tips, articles and even regular series. In fact if you have something that you think could be of use to other Commodore owners we want to hear about it.

So if you have got something which you think we may be interested in. How do you go about submitting it to us?

Below you will find a list of guidelines that will help us to deal with any item that you send in to us. We don't expect everybody to be the next William Shakespeare but if you do follow these simple rules then it will make our job a lot easier.

1) If possible all material sent to the magazine should be typed or printed out on a computer printer.

2) All text should be double spaced i.e. there should be a blank line between each line of text. You should also leave a margin of about 10 characters around the text.

3) On the very first page you should put the following:

Name of the article
Machine that it is for
Any extras required - disk, printer etc.
Your name
Your address
Your telephone number

4) The top of every page should have the following information on it:

A abbreviation of the article title
Your name
The page number

For example, suppose you had submitted an article on C64 interrupts. You should put something like the following at the head of the page:

Interrupts/15min/1

5) Please make sure that you do not make any additional marks on your text especially underlining.

6) Try and write in clear concise English, it does not have to be a work of literature but it must be comprehensible.

7) On the bottom of each page you should put the word MORE if there are more pages to the article or UNDO if it is the last page.

8) If possible, enclose a listing of all programs.

9) Under no circumstances use a staple to hold the pages together. Use a paperclip instead.

10) Programs should be included on either disk or tape. Make sure that you SAVE two copies of every program so that we have a better chance of loading them if problems occur.

11) Programs under 10 lines can be included in the text, if your program is longer than this you must enclose a disk or cassette.

12) If your article needs any artwork then supply clear examples of what is needed. We don't expect you to be an artist but we do need to see what is required.

13) Photographs, if necessary, must be either black and white prints or colour slides. We can take shots ourselves so don't worry about this too much.

14) Submissions of any length are welcome. If you have a five line routine that you think may be of use to someone else we welcome it just as much as a full blown six part notice.

15) Payment varies quite a lot and depends on quite a number of factors, such as complexity of program, presentation of program, number of magazine pages it takes up etc. Payment is generally between \$10.00 and \$200.00.

16) All payments are made in the month that the magazine containing your article has appeared in print.

17) If we do find your submission suitable for inclusion in the magazine we will write to you giving the terms of publication, the rate of payment and an agreement form. Prompt return of this form will allow us to use your program as soon as possible.

18) If you want the program returning to you, should we find it unsuitable for publication, then you should enclose a stamped self addressed envelope.

19) The last and most important point to make is 'get writing', we are waiting for your articles.

ACE2
THE ULTIMATE
HEAD TO HEAD
CONFLICT

Using an Epson-type printer with the C64

The Epson-Type printer is probably not the best use when used in conjunction with a word-processing program such as Commodore's own Easy Script.

Interfacing a C64 to your printer can sometimes be a real chore. It is necessary initially to obtain an interface cable to connect the C64's user port to the printer's Centronics interface. This can be bought for about £20 (including some interfacing software) or can be made for about £6 if you are handy with a soldering iron (see separate panel). No expensive interface cartridges are necessary!

Connect the printer to the C64 and load up Easy Script. On the initial screen you should enter a "P" in printer type and a "C" when you are prompted for interface type. From then on the printer responds normally and you may use a number of extra command characters to exploit the various modes of the printer. Some details are found on the Easy Script disk in the "MX/TX info" file which you can print out.

Overcoming Problems in Basic

Listing BASIC programmes is a possible problem since Epson printers don't have the special Commodore

control/colour control symbols. However, concerning this is not too difficult - load and run the BASIC extension program supplied with November's *Four Commodore*, load the program to be listed, and use the CODE command to convert the listing into a readable format without special codes. Now open a file to disk or tape and list the program as follows:

```
Disk: OPEN 1,2,"Programme.m
TXT,S,W":CMDQ:LIST
Tape: OPEN 1,1,"Programme.
TXT":CMDQ:LIST
```

This writes the program as a text file. If you now use Easy Script you should be able to load this file and print it as normal. This has the added advantage that your listing will have pagebreaks that don't print over the perforations. Also you can re-format the listing to indent FOR/NEXT loops, etc.

Without the Basic Extension

If you don't have the BASIC extension

then don't worry, any special characters will usually appear in the listing as blank spaces. If you don't have a word processor then it is possible to use the interface software supplied with the cable. Or run this short program by P. Corcos which echoes all screen output to the Commodore printer (activated/de-activated by SYS 49152):

```
10 FOR C = 49152 to 49256 :
   READ B
20 POKE C,B : NEXT C

Making a Centronics Cable

If you feel that you can tackle fairly fine soldering then you can make your own Centronics cable quite easily. You will require:

- 1 x 8 Amplified 36 way male Centronics plug for the printer end.
- 1 x 8 Commodore 64 way port edge connector for the C64 end.

2m x 12 core shielded round cable. (These should all be available from hobbyist electronic shops.)

The two plugs must be wired as follows:

Printer end

Computer end

PRINTER	C64
1	M
2	C
3	D
4	E
5	F
6	H
7	J
8	K
9	L
10	B
16	A

Please note: Making the lead longer than 2m is likely to cause problems (technically known as "Signal error").

Easy Script and Epson-type Printers

If you have successfully connected

your C64 to an Epson-type printer you may find it helpful to know how to get all of the printer's special functions to operate from Easy Script. Some of the special characters required to operate an Epson printer are integral to Easy Script since Precision Software's final Epson is aimed, when they designed the program.

These features are accessible by pressing<F1> and then one other key. Other functions must be sent to the printer as a row of characters, usually commencing with the ESCAPE character which is produced by pressing<F1> and then the up-arrow which then appears as a reverse "B". Escape and "B", for instance, select auto printing.

Some functions require the use of other character codes which are not available from the keyboard such as

the ASCII character whose code is 0. In order to use these it is necessary to predefine a special character for each code and assign that character the required decimal value.

Easy Script provides up to ten such special characters which can be used by pressing<F1> followed by one of the numbers 0 to 9. To define, say a character of ASCII value 65 to key 0 and a value of 87 to key 9 type a line in Easy Script as follows:
 <F1>0=65=65octans

Note: pressing<F1> followed by a "0" should produce a reverse "B". When printed this character will act as if it were ASCII 85 (i.e. a capital "A"). It is useful to define 0=0=1 since many functions use these ASCII values. Some other printer commands are produced by <F1> plus a short command.

Controls for Epson-Type Printer with Easy Script

Errors checked on/off	<F1>E and <F1>Z
Emphasised	<F1>X and <F1>Y
Underlined	<F1>G and <F1>A
Double	<F1>B and <F1>K
Normal	<F1>N and <F1>D
Generation	<F1>T each character.
Generation on constant	esc "B" 0 until
Generation off	esc "T"
Successes	<F1>V each character
Successes on constant	esc "B" 1 until
Successes off	esc "T"
ELITE	<F1>/pt10
PICA	<F1>/pt12
Italic	esc "i"
Italic off	esc "p"
Proportional on	esc "p" 1
Proportional off	esc "p" 0
NLD on	esc "x" 1

BLD off	esc 's' 0
Disable paper-end error	esc '0'
Enable paper-end error	esc '9'
Initialize printer	esc '0'
9 LPI line spacing	<F3>/1p0
6 LPI line spacing	<F2>/1p6
7/72" line spacing	esc '1'
Line spacing n/72"	esc 'W' n
Line spacing n/216"	esc '3' n
Standard density graphics	esc 'K' n ₁ n ₂
Double density graphics	esc 'L' n ₁ n ₂
3/4 density 3/4 speed graphics	esc 'Y' n ₁ n ₂
Good density graphics	esc 'Z' n ₁ n ₂
Backspace	<F10>/Backarrow

Most of these commands are self-explanatory, but a few need explanation. Backspace can be used to produce special characters by combining two others e.g. using $\langle \text{esc} \rangle$ and $\langle \text{F10} \rangle$ to produce Φ . First type $\langle \text{F10} \rangle$ then $\langle \text{esc} \rangle$ backarrow then $\langle \text{F10} \rangle$. This will produce the new symbol.

Producing single graphic characters is done in a similar way to user-defined graphics on the C64. The characters are designed on a grid 8 dots high by up to 65535 dots wide. Suppose we want to define a lowercase Greek DELTA:

Note that it requires 7 ASCII numbers to define this character, 7 in Low byte/High byte format is 7 and 0 i.e. $(1 \times 7) + (0 \times 256) = 7$.

Now we define the ASCII characters for each column, plus two for the numbers of columns to be used:
 $\langle \text{esc} \rangle \langle \text{K} \rangle \langle 0 \rangle = \langle 1 \rangle \langle 2 \rangle \langle 1 \rangle \langle 3 \rangle \langle 1 \rangle \langle 2 \rangle \langle 4 \rangle \langle 8 \rangle \langle 5 \rangle \langle 1 \rangle \langle 6 \rangle = 128 \times 7 = 896 \times 8 = 7168$

To produce the delta in single density graphics we use type:

```
<esc><K><0><1><2><1><3><1><4><1><2><4><8><5><1><6><1><6><1><6>
```

To produce the delta in double density graphics we must have double the number of columns so we define:

```
<K><2><14
```

and type:

```
<esc><L><0><1><2><1><3><1><4><1><2><4><8><5><1><6><1><6><1><6><1><6><1><6><1><6><1><6>
```

The same principle holds for quad density graphics.

One final trick - micro-lettering! This is achieved by using subscripts (which are half-height) with condensed mode characters and also reducing the line feed to about half the normal distance.

Select Condensed mode by using $\langle \text{esc} \rangle \langle \text{Z} \rangle$.

Select Subscripts by using $\langle \text{esc} \rangle \langle \text{S} \rangle \langle \text{F} \rangle$.

Choose a line spacing of about 14/72" and therefore define $\langle \text{F1} \rangle \langle 9 \rangle$ as 14 by: $\langle \text{F3} \rangle \langle 9 \rangle \langle 14 \rangle$ return

Select 14/72" line spacing by using $\langle \text{esc} \rangle \langle \text{A} \rangle \langle \text{F} \rangle$.

Example given for micro-lettering only. Density graphics using any font.

Shadow Boxing

Use the shadowy area of your computer's memory to improve your Basic storage space.

By Rick Astley

A rather back-handed compliment that may be paid to the C64 is that it has encouraged many a programmer to learn machine code, the reason being that its space-saving Basic is rather slow for some types of program.

However, there are programmers who do not necessarily agree that a move to machine code is a progressive step. To meet these programmers' needs, many machine code routines have been written which augment the C64's Basic. The following describes three of them.

The programs have been written in recognition that the 64's 40K of Basic bytes can be severely drained by the need to store data. This data may represent numerical or text information, sprites or perhaps screen data and associated colour memory. The 4K of memory from 49152 to 49327, which any address, is nevertheless rather limited. The programs we are to meet here, known by mnemonics MEN, MAKE and STRET, make the 8K RAM hidden in the shadow of the Basic interpreter, much more accessible in Basic.

The shadowy memory referred to, between 40960 and 49151 and known as LOBAM, is actually perfectly simple to POKE to in the normal way. The C64 knows that it is futile to try to write to ROM, and so responds to any attempt to do so by switching the ROM out and the RAM in to receive

the POKE. The Catch 22 with LOBAM is that in order to POKE it, you need to switch the ROM out; however, this ROM is the Basic interpreter and with it switched out, the POKE instruction cannot be understood.

The answer is to write a short machine code program which can access the Shadow RAM. The program here is called MEN, short for Memory Exchange. MEN will exchange any nominated segment of memory for any other of identical size. If a chosen area includes that from 40960 to 49151, then LOBAM will be exchanged. This allows the Basic programmer to LOAD or POKE data to LOBAM (sprite data perhaps or a screen), and when required, call MEN and swap it for similar data which is not required for the moment, and which is in memory-accessible to Basic. No data is lost, calling MEN again will re-exchange each byte back to its original place, or to some other position if you change the parameters.

Before using MEN it is necessary to decide on three pieces of information: the number of 256-byte blocks to be exchanged and the two addresses from which they are to start.

As an example, suppose you wished to swap the 8k bytes from 32768 to 40959 for that in LOBAM from 40960 to 49151 inclusive. First, remember that the area 32768 to 40959

should have been protected from being over-written by Basic if you want to use it for data storage. Do this by POKEing location 52, the bottom of string storage, and 50, the highest address used by Basic, with 128 (because $32768/256=128$) before RUNNING any programs. The size of the memory to be exchanged is 8k, which equates to 32 blocks or 8192, so the number of 256 byte blocks involved is 8192/256, which is 32.

Your program line may look something like this:

```
5 POKE 52,128: POKE 50,128
8 SYS 50000,32768,40960,32
```

MEN is wholly portable and, although it has been put at 50000, and is called by SYS 50000, it may move to wherever you wish by changing line 10 of the basic loader, and modifying the SYS command accordingly.

Saving from Memory

MAKE is the Memory, SAVE program. Unlike MEN, which is RUN from within your program, MAKE uses a small amount of your memory but is not needed within the program. However like the other two programs it may be moved to any convenient area in the manner explained here. If using a disk drive, the cassette buffer is available to you and in this case

MAVE is outside your main program/data area.

MAVE is called by the immediate command:

```
SAVE 8000,SA,EA,"FN",DN
```

where: SA is the start address (usually 8000); EA is your end address + 1; FN is your program name; DN is the saving device number (1 for cassette or normally 8 for disk).

Program: shadow

```

Where MAVE differs from other SAVE utilities is that, should you have data stored in LDRAM, then it will save this, rather than the Basic interpreter ROM.

Overcoming LOAD Problems

Unfortunately, there is a disadvantage to using a cassette when LOADING to LDRAM. The C64 loading system will LOAD your data into LDRAM, but this data is recorded twice on your tape, and at the second pass the system compares the tape data with that supposedly LOADED on the first pass. This is normally a good check for LOAD errors, but when loading to LDRAM the check is made, not against the contents of that area, but against the ROM above it. The result is an error message which you can ignore in immediate mode, but which stops a program if the LOAD is made from within it.

LOADING data into high memory from disk can also be a source of annoyance, but this time, the difficulty occurs in immediate mode rather than from within programmes. The problem reveals itself as an out of memory error, the system assuming that because the last data was high in memory, everything below it is full.

SYSSV overcomes both these quirks. SYSSV starts 155 bytes after MEX and so, if you keep the basic loader start at 50000 and then make the variable SY equal to 50155, you call it as follows:

```

SYSSV:"NAME",LJ
for tape or
SYSSV:"NAME",LJ
for disk.

```

MEX, MAVE and SYSSV have been kept quite simple, using many routines already resident in the 64, so that they will not take hours to type in via the single Basic loader MHAIMW. Nevertheless, it is worth noting them, and practising their use with the short Basic programmes listed here called SCREEN TEST 1 and SCREEN TEST 2.

Testing

First LOAD and RUN SHADOW and, if the computer responds with "OK", delete the Basic loader with NEW. Next type in SCREEN TEST which operates as follows:-

Line 5 sets the character colours. This line is required only on older C64s. If POKE 1024,100 on a freshly switched-on computer does not produce a square in the top left hand corner, you will need this line.

Line 10 sets the variable MEX to the start address of the program; Line 20 draws a series of vertical lines onto the screen; Lines 30 through 60 draw a similar set of horizontal lines in LDRAM; Line 70, the SYS command directs the program to the routine MEX, the memories to be exchanged to start at 1024, (the screen) and 40000, (the start of LDRAM), and the amount of memory involved to be 4 blocks of 256 bytes which equates to 1024, exactly one screen's worth of data; Line 80 ensures that the exchange occurs while the flying spot, which traces your T.V. picture, is off the screen; Line 90 loops back to re-exchange the data.

SAVE and RUN SCREEN TEST. Note how slowly the vertical lines are drawn in Basic and wait a little longer for the horizontal lines to be drawn in LDRAM. As soon as MEX is called, however, the speed of the machine code program is immediately evident, as it alternately exchanges the vertical and horizontal lines from screen to LDRAM. In fact, the speed of interchange produces a chequerboard pattern which is even more apparent if line 80 is deleted.

Now press RUN/STOP and SAVE the pattern in LDRAM with: SYSSV:0000,4000,"PATTERN",1 If using disk, then the last digit should be set to 8. As with standard SAVE routines you may add a final 1 as a secondary address to ensure that the pattern LOADS back to the memory from which it was SAVED. This can also be achieved by adding 1 when LOADING.

Now modify SCREEN TEST 1 to make program called SCREEN TEST 2. In the new program: Line 1 is simply an aid to memory; Line 10 ensures the program RUNS from line 20 after LOADING "PATTERN"; Line 15 has to be added. SYSSV calls the LOAD routine, and is actually SYSSV where SY = 50155; Lines 30 to 50 are modified so as to draw a diagonal pattern, which

contrasts with the horizontal or vertical lines, whichever were LOADED with "PATTERN".

Line 80 is no longer used, and should be deleted.

Lines 70 to 98 remain unchanged.

When it is RUN, SCREEN TEST 2

PROGRAM: SCREEN TEST 1

```

70 1 RUN SCREEN TEST
87 3 POKE SCREEN,14;PRINT SCREEN
97> POKE SCREEN,8
98 99 DEL=25555
99 88 FOR I=0 TO 99:STEP 1
   >POKE I,30;POKE I+1,148:NEXT I
88 88 FOR I=0 TO 99:STEP 1
   88 88
85 78 FOR I=0 TO 99:POKE I+1,30;
   NEXT I
81 80 FOR I=0 TO 79:POKE I+1,30
   &NEXT I
80 80 NEXT I
78 78 FOR I=0,100,1000,1
76 80 GOTO SCREEN,188 GOTO SCREEN
   :GOTO SCREEN
74 80 GOTO 78
  
```

should first LOAD the SAVED "PATTERN" without the error message which would normally occur from a late LOAD into LORAM.

Next the diagonal pattern will be drawn, after which MEX starts wrapping the pattern LOADED into LORAM with the diagonals drawn by lines 20 to 56.

In the above exercise, MEX, MOVE, and SYSSY have all been used. Each, however, may be loaded elsewhere in memory, either independently, or as a single program. To do this, change line 80 of the Basic loader. Once loaded, MOVE can be used to SAVE each one as a machine code program, as was done with "PATTERN".

Note the position of each program when loaded using SHADRAW:

MEX runs from 30000 to 30074;

MOVE from 30075 to 30084;

SYSSY from 30113 to 30098.

The ability to use LORAM gives

the Basic programmer continuous RAM from 2048 to 53247, save for the 100 bytes used to store the entries described here. Used effectively, most elaborate Basic programmes can be produced, hopefully compensating for that obnoxious lack of speed. 10

PROGRAM: SCREEN TEST 2

```

70 1 RUN SCREEN TEST
87 3 POKE SCREEN,14;PRINT SCREEN
97> POKE SCREEN,8
98 99 DEL=25555 99=99+100;I=99
   :I=I+1:POKE I

TOTAL BACK-UP POWER COM 64/128

PERIPHERALS...THE FINAL FRONTIER...OUR MISSION...TO BOLDLY GO WHERE NO OTHER UTILITIES HAVE GONE BEFORE

APPYRYS LOG...THE TOTAL SOLUTION TO ALL YOUR BACK-UP NEEDS...THE ULTIMATE BACK-UP CARTRIDGE HERE YOU'VE

ASSTANT OPERATIONS

Action Replay II offers more powerful, sophisticated and flexible backup options than any other cartridge. It's the only backup utility program that can automatically backup a whole cartridge in type 1 or type 2 cartridges. It can also create a copy of a cartridge. Available in two versions: **Standard** and **Plus**.

STORAGE UPDATE

Simple to use, set your backup and update options. Backup, Format, Type, Target Size, Date and Time, System Type, File Allocation Table (FAT), Just Backup and Backup a Copy.

At the end of each backup, you can independently set the backup.

On a system with a hard disk, programs can be updated from the cartridge. Update files to your hard disk or to the cartridge.

Place the action that you're going to use with the master device. Select the file to be backed up. Then select the type of backup - disk for conventional systems or your program or files - disk for cartridge systems. Then select the type of backup - type 1 or type 2.

Program files: Backup your whole system. Then select the type of backup - type 1 or type 2.

File backup: Backup your files. Then select the type of backup - type 1 or type 2.

File backup: Backup your files. Then select the type of backup - type 1 or type 2.

File backup: Backup your files. Then select the type of backup - type 1 or type 2.

File backup: Backup your files. Then select the type of backup - type 1 or type 2.

Compatible with fast ROM and Turbo ROM systems.

Backup process includes speed - faster than any other.

Special cartridge techniques. Each program is saved as a single file.

Thirteen multiple type programs to do - more than any other cartridge. Includes one and a half cartridge - a single backup.

Special file name (file name) information by choosing System software (file name).

Fast file backup (file name).

Backup and update hard disk.

PLUS Built in FASTLOADER

Action Replay II offers a built-in disk fast loader which speeds up loading times. Uses no memory - maintains the system. The FASTLOADER CD-ROM drive for this feature.

ONLY \$29.99
POST FREE

LINK TO THE SECOND FRONTIER

Action Replay II offers more powerful, sophisticated and flexible backup options than any other cartridge. It's the only backup utility program that can automatically backup a whole cartridge in type 1 or type 2 cartridges. It can also create a copy of a cartridge. Available in two versions: **Standard** and **Plus**.

SYSTEM	DATA TIME	RECORDS/SECTOR	RECORDS/RECORD
ACTION REPLAY MK II	20 SECS	THREE	NO
ACTION REPLAY MK II	14 SECS	THREE	NO
FASTLOADER MK III	20 SECS	THREE ON THREE	NO
FASTLOADER MK III	20 SECS	THREE	YES
FASTLOADER MK III	20 SECS	THREE	NO

Specifications of Action Replay II will vary slightly from those of the cartridge. Existing Action Replay II owners can check their own data by sending £2.00 post free. Allowed to send your cartridge. CD-ROM MK III on the back cover of the cartridge. (See £2.00)

THE ACTION REPLAY II CARTRIDGE
The Action Replay II cartridge is a sophisticated backup utility program that can automatically backup a whole cartridge in type 1 or type 2 cartridges. It can also create a copy of a cartridge. Available in two versions: **Standard** and **Plus**.

PERFORMANCE GUARANTEE
Action Replay II offers more powerful, sophisticated and flexible backup options than any other cartridge. It's the only backup utility program that can automatically backup a whole cartridge in type 1 or type 2 cartridges. It can also create a copy of a cartridge. Available in two versions: **Standard** and **Plus**.

Code Comfort

York Electronic Research is a small company specialising in hardware and software utilities which are worthy of more attention. The latest releases include a 6502 assembler and a Z80 compiler for the C64.

By Eric Doyle

The 6502 Assembler from York Electronic Research (YER) is a no frills, two-pass assembler which solves the problems of coding considerably by allowing labels to be used. This means that subroutines can be called by giving them a name of your choosing and variables used within the routine can also be named. It's easier to explain this by example.

Let's use a short routine for clearing four lines of the C64 screen in conventional mnemonic form:

```

C000 LDY #328
C001 LDA #328
C002 STAS0FF,Y
C003 STAS047,Y
C004 STAS047,Y
C005 STAS047,Y
C006 DEX
C007 BNEC004
C008 RTS
  
```

In YER assembly code this becomes:

```

0001 DHC 49152, decimal for C000
0002 SPACE=32
0003 SCREEN=1024
0004 WIDTH=40
0005 ROUTINE STARTS HERE
  
```

```

0006 LDY #WIDTH
0007 LDA #SPACE
0008 CLEAR: STA SCREEN-1,Y
0009 STA SCREEN+38,Y
0010 STA SCREEN+78,Y
0011 STA SCREEN+118,Y
0012 DEX
0013 BNE CLEAR
0014 RTS
  
```

As you can see the purpose of the routine is much clearer and the facility to include REM style statements following a semi-colon adds to the clarity. The main advantage is that jump and branch calls rely on a label, not a finite memory location. This means that adding a line within the program automatically adjusts the calls accordingly in assembly of the final code. Relocation is auto-center. By simply changing the ORG address, the assembler will then use this as the base address for all jumps and branches.

Although I've said that YER's assembler is lacking in frills this has the advantage of leaving 99% of memory free for program workspace. Add to this the fact that programmes can be chained onto one another and you soon see the power that this utility conceals.

There are only fourteen editor commands:

- A - assemble current source text
- B₀ - return to Basic
- C - verify a saved file
- D - delete lines
- E - edit a line
- G - get a file from tape/disk
- H - scan text for a string
- I - insert new lines in text
- L - list a line, set L
- N - clear memory (new)
- O - recover text (old)
- P - save text to tape/disk
- S - define output device
- V - list text to screen

Some kind of DOS to call up disk directories and contents is wanted if it would have been a sensible addition, but this would be at the cost of assembler program space. At least you can always switch back and forth from program control to Basic without disturbing your assembler code.

Within the actual assembler listing the normal mnemonic codes work as expected but there are ten directives to assist program writing:

```

LOF
LON
CHN
BEG
  
```

```

0039 LD #,1023
0040 LD #,1023

```

DBY
DWD
SFC
POK
ORG
AUT

At assembly code generation time LOF and LDN simply suppress or enable the listing of the assembled code to go to the monitor screen. As printing to the screen takes time, a significant increase in assembly time can be gained by suppressing the screen display of the code when the assembly option (A) is employed.

CHN and NSG always appear at the end of programs when several

listings are chained together. CHN tells the assembler to load the next part of the chain during assembly, and NSG is used at the end of the final part of the chain so that the second pass can be initiated from the first part program of the assembled chain.

The reason the chain has to be loaded twice is that the first pass sorts out the labels and their related actual address in the assembled code. The second pass is to insert these final addresses into the code as it assembles.

DBY and DWD are used when look up tables are inserted into a listing. DBY stands for Define Bytes and anything following this command will be stored as a memory byte or

string of bytes. For example:
DBY 147,"READY"

This would store the clear screen (147) value as the first byte followed by each value for the word READY in the following five memory locations.

DWD is followed by a series of table names used in the program. At assembly time the program stores the high and low bytes of the memory locations of the label as a lookup table.

SFC is followed by a number which allows a gap of up to 256 bytes to be placed within a program to leave space for variables and arrays.

At assembly time you have two options. The code can either be poked directly to its final address or stored as a basic hex/octal selector program.

The straightforward memory assembly is directed to the start address by the POK command. In our screen clearing routine POK 48152 would cause the assembler to try to poke the code directly into memory. In this case a clash with the storage area of the actual assembly program would cause an OUT OF MEMORY message to be generated forcing the use of the second assembly method.

ORG assembles the program in the low basic programming area provided by a routine which will move the block of code to its actual execution address when RUN is entered. The AUT command can also be used for force the boot program to jump to the new code without having to enter a SYS command.

On the whole the assembler works well but conviction of a bad line is a long-winded affair. If an error has been entered in line 8006 of the program, the correction routine would look like this:

```

L6 list correction line
8006 LD# # WIDTH
D# delete that one line
I insert a line
ORG LD# # WIDTH

```

The instructions are good but the area of saving assembled code is not covered in sufficient detail. There is no way within the program to save the assembled code so a return to Basic must be made and a new run then be made using the normal SAVE command. None of this gets a mention which could confuse a beginner, and it took me a while to work it out for myself.

```

```

Nevertheless the York Electronics Research Assemblies is one that I would recommend for someone making their entry into machine code programming. All of the essential features are included within the program, and there are not enough commands to confuse a novice.

The Z80 Emulator

The second of YER's products is the Z80 Emulator. Before going any further I would just like to say that this is purely an educational aid. There is little possibility of transporting the code directly across to a Spectrum or Amstrad machine. This is an emulator not a simulator.

For a long time after mistaking 6502 machine code I wanted to try Z80 code, but I was inhibited by the fact that I'd have to buy another computer to do so. If only this emulator had been available then I would not have had to shell out a fortune on a machine I don't really need.

The YER emulator is really a compiler which takes each Z80

command and translates it into a corresponding piece of 6502 code from a library stored on disk. It's a bit like Basic ready in the sense the interpreter takes the Basic keyboard strokes and executes a corresponding piece of code. The result is that the program runs more slowly than a dedicated machine code emulator as is the case with this emulator. A compiled Z80 program runs at about a sixth of the speed of a dedicated 6502 routine. Not that this matters a great deal as long as it runs well enough to show if the Z80 coding would work.

The Z80 assembler is a lot more flexible than YER's 6502 equivalent and includes facilities such as search and replace, a simple delete command, hex/decimal/binary calculator and a complete DMS support.

The actual assembler listing follows almost the same conventions as laid down by the 6502 assembler except that the code follows the correct Z80 mnemonic syntax.

Any emulation of one CPU by another is liable to compromise in the interests of speed and efficiency. In

this case only the essential Z80 flags are supported: carry, zero and interrupt. With the exception of the IR port, all of the CPU registers are supported, including the twin alternative set of registers. The net effect of these omissions is that some of the commands cannot be supported by the emulator. This is limited to 28 specific commands and doesn't cause any problems in learning Z80 code.

After writing your code in the assembler editor, you then save it to disk and load the compiler program. The compiler produces the object code which in turn is converted into the final 6502 version by the special save program.

This is a novel and relatively cheap way of becoming familiar with the Z80 environment.

Features:

Product: 6502 Assembler. **Price:** £12.95

Product: Z80 Compiler. **Price:** £12.95

It's easy to complain
about advertisements.
But which ones?

Every week millions of advertisements appear in our papers or on television. Most of them comply with the rules contained in the British Code of Advertising Practice.

But several thousand do not and represent a real complaint. Because not every advertiser follows the rules, it's important to know what you can do and your responsibility as the Advertising Code. Then, for advertisements before you, see if you can do anything to help.

The Advertising Standards Authority.
If an advertisement is wrong, we have to put it right.
ASA Ltd, Dept 2/Book House, Torrington Place, London WC1E 7EH

The above is based on the current code of advertising practice.

Games Reviews

A look at the latest selection of games available.

ACTION PACK 3

The Action pack series are compilations of Aliga's programmes that are sold exclusively through WH Smith. The third in the series, contains the Commando style shoot 'em up, Who Dares Wins II, an odd arcade game called Kettle, the terrible indoor bowling and superb Trap.

In Who Dares Wins II you're a man with a mission, a machine gun and eight grenades. Your objective is to single handedly take enemy outposts and free any of your comrades that need your unique (blast everything) help.

Indoor Bowling is a two-pin bowling style of game but it lacks lost pins and any point. The aim is that any balls to be bowled over daily most of the laws of physics what they move as when you get a strike they all fall over, in perfect formation as soon as you touch the first pin.

Kettle is a curious arcade adventure in which you must break free from a 30 level underground complex. To move from level to level you must find the key opener that's hidden in giant pots. Unlike wisely, these pots also need a constant stream of energy draining bubbles that must be deflected by your shield of protective rotating crims which can also be used to wipe out aliens. A novel game but fun to play particularly if you like Kettle.

The final game, Trap, is undoubtedly the best of the compilation and after a simple last step expensive change through an aliened belt becomes a Zaxxon style game in which you must zap aliens, disable lasers, collect fuel, shoot spy eyes (if these escape they alert the dreaded police unit) all to collect orbs to gain a better ship to survive a harder course.

The skill of the game (apart from surviving) is to plan your attacks so that you take out the levels alien first there's only a set of quota of aliens per level before blasting the boats and lasers to get through to the end of the zone where you have to proceed on foot, pass walkway per-chains your orb. A great shoot 'em up in the finest tradition.

Trap and Who Dares Wins II are the games worth considering in this compilation, and the others should be viewed as a bonus. If you've got neither then it's worth a look but if you've already got one of these then again.

Title: Action Pack 3, Supplier: Aliga, Orange Street, Slough, Berks, RG4 0AF, Tel: 0742 751766. Machine: C64, Price: £4.99. Originality: 3/10, Playability: 5/10, Graphics: 6/10, Fun: 5/10.

GUN RUNNER

Vrooom, daa daaa, broom, oh sorry but I'm just been playing the new game from Power House, Gun Runner and I'm hooked!

You play a highly trained helicopter pilot on a mission to rescue your trapped buddies. Their ground bases have been blown to bits and they are sitting ducks, out in the open as enemy planes and other deadly aircraft sweep the sky - you are their only hope. Fly into the invaded territory and shoot down all aircraft (well as many as you can) but most importantly rescue your pals.

Your helicopter has been fitted with the latest rocket launch and with a flick of a button it will drop down to ground and land and pick up any running people (your

and you will leap, hopefully right onto the grill's back, and then you eat him. Other goodies include the space exploration (expensive) when you eat right near the grill or they will slow down but won't let you get too close, just select the weapon, push the button and POW! (webers fly fast, fast).

There are loads of different traps and such like and even when you're sure there's all, this is a fabulous arcade game combined with a fair bit of strategy.

For just over a hour this game represents very good value, nice sound (Dubb Hubert), amazing parallax background.

I don't need to tell you to buy, I bet you're putting on your seat belt, go on then, get down to your local software shop. **K.R.**

Touchline:

Title: *Road Runner*. Supplier: Software Projects, Bear Brand Complex, Alton Road, Washin, Liverpool, Merseyside L27 7TF. Tel: 051-628 8331. Price: £5.99. Originality: 7/10. Graphics: 8/10. Playability: 8/10. Value: 9/10.

ROAD RUNNER

Bump, bump. Stopping only for a quick peck of corn, Road Runner zooms off into the distance leaving only a cloud of dust behind while the hapless Wile E. Coyote is left to suffer the consequences of his latest, back-fired plan. That at least is the theory.

Having started in a cartoon and progressed to an arcade game, Road Runner has finally arrived on the 64. You play the part of the scrawny looking bird and your objective is simple - to survive.

Each level presents a new series of obstacles apart from the ever-present Wile E. Falling boulders, speeding trucks, cactuses and mines must all be avoided and throughout you must keep eating piles of food.

Wile E. Coyote makes frequent use of the Acme company as he buys their latest gadgets in an ever-increasing desperation to catch up with you, so expect to see him whizzing past you at high speed on a jet-propelled skateboard, rocket, jetpack or even popo stick. Should you

come here to walk into one of the hazards you have just avoided, then so much the better.

Although a nice idea, I found Road Runner totally lacking in playability on the cassette version. Each level, although short, has to be loaded in separately from tape. When you die, the tape has to be re-wound as you start again. Even if you take the proffered short cut to the last level (you reached in the previous game, you have to wait for all the intermediate levels to load in one by one. If Road Runner had to wait this long, he would have been barbecued long since.

If you can put up with the problem of using the tape, the game itself seems to be a competent version of the arcade version and fans will no doubt want to buy a copy. Otherwise, it's a case of try before you buy. That's a definite. **G.R.H.**

ROCKFORD'S BOY

At last, First Star, the makers of the famous Rockford character have released *Bookends* I and II at only £2.99 each.

I was pretty chuffed as I was never able to get hold of the first game, which was very good. I wondered why they had waited so long to release it!

Anyway, for those of you who have not heard of these games, I'll tell you more. There was a little guy called Rockford and he liked nothing better than collect precious gems and valuable rocks.

One day, while out walking his dog, he stumbled across a cave, and being of a curious nature he decided to investigate. He sent his dog home and went in and was amazed at what he saw - huge gems and jewels stuck in the ground, so not to miss the big chance he started to collect the gems, when he had them all he heard a strange noise and noticed that the entrance was gone and a new one had appeared. So he be

went, and there he discovered another cave containing more jewels. As he progressed deeper into the complex he started to encounter various enemies such as deadly butterflies that would explode and turn into jewels. "Grrrrr," he thought, that was until he got caught up in the explosion, but strangely he felt a high tingle while he had just lost one of his three lives.

Other enemies he met included huge fireflies that would explode when hit by one of the many hammers, which caused a very powerful explosion but maybe he could use it to his advantage?

Soon Rockford meets up with the giant Amoeba, a huge green slime that slowly moves its way through the cave destroying anything that gets in its way. Then Rockford has an idea, surround it with rock so it can't move. So he does this, and waits patiently, and after about two minutes he is standing there by tapping his feet when POW! the green slime goes flying and turns into jewels. "Wow," he says, "I must have suffocated it. Quite a good idea though."

You should have the idea by now - Boulderdash and Rockford's Riot are just search-and-destroy-avoid games and prove very taxing on the old grey matter. If you do not have any of these two games then go and get them. They are very good value and you should think yourself lucky that you did not buy them two years back when you would have paid just under a tenner. Good graphics, nice sound, decent gameplay and brilliant value, which is rarely enough reason to add these to your collection. **K.R.**

Touchline:

Title: Boulderdash/Rockford's Riot. **Supplier:** Orion Leisure, Unit 7, Belfield, Middlesex TW7 1SL. **Tel:** 01-894 8190. **Price:** £2.99 (each). **Originality:** 6/10. **Playability:** 8/10. **Graphics:** 5/10. **Value:** 9/10.

HERO

You are Rockford Hero, one member of the Helicopter Emergency Rescue Operations team. All you know is that there is a mine trapped somewhere underground by a flash explosion and that you have a limited amount of time in which to rescue him.

A re-release of the old Activision game, which consists of

a number of cave systems, each one of increasing complexity. Rock falls block your way and must either be dynamited or shot through. Storage crates appear in front of you and must be shot or dodged, such as spiders, bats and green slime, a mine that try to grab you as you pass. Accidentally hitting a light switch will plunge the cave into darkness so that you have to navigate by guesswork - very dangerous as contact with lava results in the immediate loss of one of your lives. All you have to do then is to make sure that you don't plunge your helicopter into the icy water. The added time pressure does little to help either.

The game feels more than a little dated now (not surprisingly really) and is graphically crude. For all that, there is still an initial addiction but once you start remembering where all the hazards are, that also wears off soon. **G.R.H.**

Touchline:

Title: Hero. **Supplier:** Freshnet Silver, Wellington House, Upper St Martin's Lane, London WC2H 9BL. **Tel:** 01-431-1206. **Machine:** C&A. **Price:** £1.99. **Originality:** 3/10. **Graphics:** 1/10. **Playability:** 4/10. **Value:** 4/10.

TERRA NOVA

If you need to flex your fire button finger then head in Terra Nova and get tapping. It's a no frills shoot 'em up in which you have four mines to clear. In Terra Nova 'clear' means blast everything to smithereens.

To complete the game (which is extremely unlikely) you must blast your way through each of the three mines! The first trip is the relatively easy one as you can fly and blast away quite happily without worrying about fuel or ammo, but in the next two flights you must collect them by destroying the enemy ships.

Your main hazards come in the form of alien crafts that buzz you and space mines that you can't shoot but which wreck you. The mines are fixed by ground installations that must be destroyed to gain points and reduce the number of mines, leaving you in dogfight with the aliens.

The first mine is set in space and once you complete that, three times, you can tackle the battles of a ground base, an Earth like landscape and the high seas.

A fun shoot 'em up that you'll enjoy but don't spend too much.

T.H.

Titleline:

Title: Terra Nova. **Supplier:** Amos, 33 West Hill, Buryland, Essex SA12 2EL. **Tel:** 0427 825124. **Machine:** C64/Plus/A. **Price:** £7.95. **Originality:** 6/10. **Playability:** 6/10. **Graphics:** 5/10. **Value:** 5/10.

REALM

Reconstructing the entire solar system is the minor task facing you. The Planetary Orbiting Co-ordinator has developed a serious malfunction and planets are scattered everywhere. You must control an NEU droid and manoeuvre it round the Inner Co-ordinations function.

In other words, the game consists of a large maze and you must wander around it collecting objects and solving problems. As you progress, you must relocate the nine planets in their correct place around the sun.

Not all areas of the maze are immediately accessible to you. Walking past certain points causes doors to spring shut behind you, trapping you if you have not taken sufficient care over your route. Arrows point the way but their main use is that when you stand next to them, they cause doors to open elsewhere in the maze, causing a lot of backtracking. As your progress furthers, so there are items to be collected which are then used to remove further obstacles in your path.

The maze is constructed of brightly coloured blocks and designs - graphically simple but effective enough. Certain blocks are lethal to touch but it shouldn't be too difficult to work out which ones they are as skull and crossbones usually tend to conceal something nasty!

Lack of any sort of action is likely to limit the appeal of Realm to many fans, but it's not a bad game for the price.

G.R.H.

Titleline:

Title: Austin. **Supplier:** Goodbird Silver, Wellesbourne Manor, Upper St. Martin Lane, London WC2N 8JL. **Tel:** 01-631 1266. **Machine:** C64. **Price:** £7.95. **Originality:** 5/10. **Graphics:** 5/10. **Playability:** 6/10. **Value:** 6/10.

LAUREL AND HARDY

Laurel and Hardy have had a bit. Nothing so serious that you may say, they had at least one in every film that they made. Still, not everyone is delighted and can be settled in the only very slapstick comedians know how - a cartoon pie in the face.

So, Stan and Ollie set off round a strange town in search of the local bus depot. On their way, they will find plenty of opportunities to collect objects and use them to hinder the other - ball bearings, oil and broken glass. Just the sort of things an unsuspecting person can trip up on. Other features include riding on a bike to speed up your movement, recruiting the dubious services of a small dog and the presence of the Keystone Kops.

The screen is divided into three sections. The top shows Ollie's current whereabouts. All movement is shown on an east-west axis regardless of which way you are actually heading. As this is rather confusing it is strongly recommended to get a map. Likewise, the bottom half of the map is used for Stan. You can play either character against the computer or a friend.

The central area shows a picture of each character together with a series of icons indicating what he is currently carrying. The colour of your face shows how thirsty you are. You have to stop off occasionally to take on board liquid refreshment - more alcoholic of course.

I'm afraid that this is yet another example of a dreadful licensed game. Companies pay a lot of money to use a title like this and are obviously eager to get something onto the market to recoup their investment as quickly as possible. All this pressure can only squeeze one thing - the game, and it shows. In Laurel and Hardy, the action is spread over two great a distance which makes the gameplay extremely tedious in the extreme. Less than adequate game control and display don't help either. The result is a poor man's Nip Versus Spy.

Perhaps if software houses took the time and money to employ the services of a games designer and graphic artist rather than expect the poor programmer to come up with ideas, graphics and music as well as code everything, licensed games might have a better reputation. With Laurel

and Hardy, as Ollie might have said, 'Here's another fine man.'

G.R.H.

ZYNAPS

Zynaps is the latest shoot 'em up from Hewson in which you must fly your Scorpion fighter through seven alien swarms of alien spacecraft, command ships, motherhips and planet installations that threaten you in bombing and seeker missiles.

Your Scorpion fighter is fitted with a standard missile launcher but also a fuel scoop that can absorb the enemy capsules left after a mass of aliens or ground installation is destroyed. Collect enough of these and you could activate other weapon systems such as more speed, greater firepower, bombs and bombing missiles.

At the end of each sequence you will have to fight your way past a motherhip or a command vessel that can only be destroyed by several well-aimed shots or by launching missiles.

As you blast aliens and avoid their missiles as well as the background structures (that are just as deadly) your ship will get stronger and stronger, but so will the opponents you'll face.

Although Zynaps will give your fire button finger a good work out it is a little more than a Nemesis variant. It's good, but we've come to expect more than this from Hewson.

T.B.L.

Touchline:

Title: *Zynaps*. **Supplier:** Hewson Consultants, Mill Hill Lane, Farnley, Wakefield, Wetherby, West Yorkshire WF4 4ZL. Tel: 0215 822919. **Machine:** C64. **Price:** £9.99 (incl. £12.99 incl. Originality: 5/10. **Playability:** 5/10. **Graphics:** 6/10. **Value:** 7/10.

ZOLYN

Do you remember an arcade game called Qix that was then converted for every machine possible in a bewildering array of names that all ended in the letter X? Now here comes Zolyn which is the same old annoyingly addictive game that I just can't stop playing.

The game is incredibly simple. All you have to do is paint 10% of a screen by moving your zolyns and boxing off sections which then turn blue.

Naturally, there's a catch in the shape of zolyns snapping balls that can you a life if they either collide with you or a box that you're drawing with the whole lot that follows your movements in clear territory. Lose your lives and you lose the game.

If you manage to complete a screen then you're rewarded

with a bonus life and you're onto the next screen which has even more balls to avoid.

A simple but ridiculously addictive game.

T.B.L.

Touchline:

Title: *Zolyn*. **Supplier:** Firebird, Wellington House, Upper St Martin Lane, London WC2N 9DL. Tel: 01-611-5286. **Machine:** C64. **Price:** £1.99. **Originality:** 5/10. **Playability:** 5/10. **Graphics:** 4/10. **Value:** 5/10.

TABLE FOOTBALL

Have you ever played those table football games where the players are controlled by turning handles? Well, now you can bring the excitement into your home and onto your computer screen at a budget price.

The game is only a two-player game in which left and right joystick pushes move the selected bar (this is the one nearest the ball) and forward and back to kick.

The game is a best of nine goals match with the current score displayed on the pitch and set in the corners of room above the table.

Budge isn't the best software house to attempt to compressive table football, indeed Bubblebus produced a good version called Kick-off. This is not a good version for two annoying reasons.

Firstly all the players look as if they standing upright but aren't as the ball will pass under them unless you kick it. This is, of course nonsense and spoils the game as well as stopping the players trapping and controlling the ball and turns the game into a kicking match. Secondly, should you score a goal there can sometimes be scored by kicking the ball past the post (if your opponent may get the goal or occasionally both of you get it).

Even if the program wasn't bugged, it just wouldn't be worth the money even at a budget price.

The Personal Choice Collection

A trio of packages for the home or small business user which includes a word processor, database and spreadsheet program that can be used separately or integrated through common files.

By Tony Hetherington

The collection is supplied in a library box set with each program accompanied by a quick reference guide. Also a full manual is provided complete with worked examples and tutorial sessions that let you through the basic operating instructions, and then onto advanced features and finally how to interface with the other programmes in the collection.

Writer's Choice

Writer's Choice is a full featured word processor capable of handling complex documents with headers and footers, justification search and replace, formatting and a 50,000 word spell checker!

Once Writer's Choice has loaded, you are presented with a menu to write a document, format a page, LOAD, SAVE or PRINT a document or format a blank disk or produce a test print. You can then easily write a letter, memo or magazine article and correct typing mistakes, copy, move or delete blocks of text by pressing a few keys.

A Writer's Choice document can consist of 500, 40 character lines that appear on the screen as dots until they are over-typed. That should be enough for most applications but if it isn't you can chain documents together to form massive documents that can be printed out on almost every combination of printers and interfaces.

You can also read in files created by Filer's Choice and Planner's Choice and incorporate them into reports or use the Filer's Choice data to form a mailing list.

Writer's Choice is probably one of the easiest word processors I have ever used (there's always a help key in reach if you get stuck) yet it possesses some complex

features and commands. For example, the search and replace command 'tr' will find 'the' and 'The' but the command 'trc' is even more powerful as it finds part words such as 'there' and 'whether'.

Once you've created your letter, memo or article you can preview to see what it will look like on paper and then check it with the impressive Spell-Right and get a word and character count.

Spell-Right is supplied on a separate disk so you must save your document and then load it in for checking. The Spell-Right disk is double-sided and both must be used in turn to check words that begin with letters between A and N and O and Z. This takes a while particularly if you've added your own dictionary to the 50,000 words that are already checked.

Once the program has finished it highlights any words it can't find. These can be altered, ignored or added to another dictionary. If you don't know how to spell a word you can have another go, and have that checked or you can even get Spell-Right to list all the similar words it can find for you to choose between!

Filer's Choice

Every integrated package needs a database program to store and organise information so that it can be updated, sorted into order and then printed out by the word processor.

A Filer's Choice database consists of records that are created by typing on a screen and can be between 20 and 80 lines long. To create a database you simply have to type on the screen the records you want to keep and then save them to disk. You can then add new entries, delete records or edit existing ones, sort the whole file into alphabetical order (or whatever is defined as field 1) and search for a specific record or group of records by setting greater than and less than parameters.

Once you have the information stored in a format that's easily edited and updated you'll want to do something with it such as create mailing lists and print out labels and other reports or lists. Creating a report is easy as the program presents you with a list of the fields in each record in your file and all you have to do is put them in the order you want them on your form. You don't have to include all of them (instead a useful printout is a list of phone numbers) and you can signal the computer to print more than one on the same line. This report or print out can then be displayed on the screen, saved to disk to be used with Writer's Choice or printed out directly.

Planner's Choice

Planner's Choice is the third and final part of this application program package and features a fully fledged spreadsheet program for planning your finances and asking those 'what if' questions. What if VAT goes up, what if the cost of disks doubles, what if I sell 20% more games, what will happen to the price Mega Game 3? The answers and many more can be posed and answered by a spreadsheet.

	January	February
Total	238.00	282.00
Tax at 14000	12.00	12.00
Total	250.00	294.00
Tax at 14000	12.00	12.00
Grosses	900.00	900.00
Deductions	2000.00	2272.00
Profit/Loss	948.00	948.00

The uses and applications of a word processor and a database are obvious but who would use or need a spreadsheet? The answer is that you don't need a multi-million pound budget to gain from using a spreadsheet. Club treasurer's, comparing investments or home and tax systems are all made easier by using a spreadsheet and even if you're planning to run your own business, a spreadsheet printout will impress the bank manager.

Unfortunately, the spreadsheet screen looks daunting with only a few lines that outline the cells of the programmes work space. By using the Planner's Choice manual you'll learn that each of these cells can contain text (a heading so that you understand what's going on), figures and formulas to add up the contents of other cells or perform calculations. With these you can add up the subscriptions you've received, deduct the heating and lighting bills and rent of your club house and find out how much you've got left for trips or equipment and see whether this figure is increasing or decreasing, in which case you'll have to increase your rate. Similarly, a business can calculate profits, expenses and wages to set prices to keep the business afloat and be ready for any crisis such as the Chancellor deciding to put up beer, petrol or VAT.

By changing a single figure you can create a whole different set of circumstances which the program can recalculate in seconds giving you the new results and a jump ahead of the opposition.

Once your spreadsheet is complete you can either save it to disk and incorporate it into a word processor document or print it out individually directly from Planner's Choice.

The Personal Choice Collection is a powerful trio of packages that will put your C64 to work. There is also C128 versions that load automatically from disk that happily exceed the screen size from 40 to 80 characters. The collection is a little expensive at \$69.95 but does contain all you need to write documents and check the spelling, store information and get your finances into shape. The packages are easy to use and are supported by some superb documentation.

Twainline:

Name: The Personal Choice Collection, Supplier: Personal Choice Software, Tel: 04451 1100, Machine: C64, Price: £69.95.

Arcade Action

Producing your own scrolling messages and plotting on the screen.

By Tony Crowther

Scrolling messages have become commonplace within game programs. Each message can range from game instructions to amiable banter about friends and other programmers. Here's a routine that allows you to scroll a message up to 255 characters long across the top of the screen.

Drawing borders and lines, and doing it quickly, is very important in games writing. So, I've also presented a routine that enables you to plot small blocks extremely quickly at any point on the screen.

Get It Scrolling

The routine presented here for scrolling messages is nothing to jump up and down and shout about. However it is a simple but effective way of producing your own scrolling messages.

As usual there are three programs associated with the message scroll routine. Firstly, we have the Basic loader, called 'MESSAGE LOADER'. This routine builds the necessary machine code within Basic DATA statements. These are then POKE'd into the correct area of memory when the program is RUN. The second listing, 'MESSAGE M/C', is an assembly version of the program so that those of you interested in machine code can see how the program works. The third routine, 'MESSAGE DEMO', is a simple demonstration that shows the program in operation.

Using The Routine

The scrolling is extremely simple to use and should cause you no problems. It does require the IRQ DATABASE routine to be in memory before you RUN. For those of you who missed the IRQ DATABASE in the March 1987 issue of Your Commodore I have included it here. To use the routine you should follow this procedure:

- 1) POKE \$384
- 2) Clear the screen.
- 3) Print the message on the screen (255 characters long).
- 4) Type SYS \$0817, COLOUR, SPEED.
- 5) Clear the screen.
- 6) POKE \$38, 1 to return the message on.

The values for COLOUR are the normal colour codes as described in your manual.

SPEED should be between 0 and 8, where 0 means stop and 8 is fastest. If you are still unclear as to what you should do read the example — it should make things clearer.

Screen Plotting

The second routine presented here allows you to place a quarter-character sized block, 4 x 4 pixels, at any specified position on the screen in any colour.

At first glance this routine will appear to be of little use in arcade programming, however it will become invaluable when drawing borders or lines on the screen.

Once again three programs are presented. The first, 'PLOT LOADER', is the Basic loader for the PLOT routine. The second program, 'PLOT M/C', is the machine code version of the program. As usual a demonstration is included, 'PLOT DEMO', showing the program in use. The syntax for this routine is as follows:

SYS \$0818, X, Y, COLOUR
where X is the range 0-79 and is the horizontal co-ordinate for the dot. Y is in the range 0-49 and is the vertical co-ordinate of the dot.
Colour is a standard colour code (0-15).

Brought Forward

In the last gripping episode I set you a couple of tasks to perform with the routines that I had already published. I am sure that you all managed to carry out the specified tasks without too many problems. Just in case you didn't, I have included here my versions of the programs.

The first program 'DEMO EXTENSION', links together the two sprite routines and produced animated, moving sprites. The second routine, 'HELLO DEMO' moves last month's sprite around the screen.

If you couldn't get your own sprites moving then following these programs through should make life easier.

REMEMBER before you RUN any of these programs you must have the relevant routines from my previous articles in memory or your computer will crash.

GAME OF THE MONTH

Pirates

If it's excitement and danger on the high seas that you're after, look no further than the latest release from Microprose.

Away behind! No, it's not a reference to the use of the Eicker but Pirates, the swashbuckling game of derring-do and blood and thunder for, in any case, blood and blunder from those masters of the simulation - Microprose.

In the seventeenth century and like many of your contemporaries, you decide to seek your fame and fortune on the high seas. Just how your career develops is up to you. Maybe you fancy becoming an outright pirate, plundering anything that you can get your hands on, regardless of its country or origin. Or perhaps you would rather serve king and Country (England, France, Holland or Spain as a privateer) in which case you act as a sort of legalised pirate, providing you only plunder the enemy. Should you have delusions of grandeur, you can try and emulate the fate of some of history's greatest seafarers - Francis Drake or Horatio Morgan for example, although only the experienced should apply.

Your business in the West Indies has failed and you decide to sign up on a ship and seek alternative features. The skill level you choose determines how well your future career will behave but also how big your share of the plunder will be. You also get the chance to specialise in one particular skill such as fencing, navigation, gunnery, wit and charm or medicine. Fencing is strongly recommended for beginners. Your first trip as a crew member goes well and the crew suggest getting rid of the old captain and elevating you. The deputy is settled in the time honoured way - a duel. You

win, and it's not too difficult, and you assume command of your first ship.

The real game starts off at a friendly port. Here you can pick up the latest gossip, sell your plunder, recruit new crew and visit the Governor. He will give you a quick run down on the main political news, i.e. who you are at war with and will invite you to go out and sink a few of the enemy's ships. The Tavern is a source of more specific gossip, e.g. which crews have been hit by disease, where the latest silver deposits have been found and so on. These nuggets of information influence your strategy as you decide which areas to explore.

After gathering all the information you can, you will want to sign up a crew and get sailing as quickly as possible. Although you are provided with a map of the Spanish Main, you must still learn the principles of navigation. Each type of ship behaves differently in the wind and you will have to discover how to make the best speed when the winds are against you. Get it wrong and you may run out of supplies and end up with a mutinous crew.

Some of later, your horizon will open a veil on the horizon. All you know is where waters you are in, so you will probably want to go to a bay and investigate. Chances are that the will be Spanish (of course that you are playing a Brit). You may also be a pirate ship, Dutch or French.

Large for some actions, you decide to close for battle. The two ships are displayed on the battle screen together with

ship relative strengths. You have three basic choices in battle. You can try and sink the enemy, you can try and run her with the intention of boarding her (at you can run away). The battle develops into a cut and mouse struggle as each ship tries to make the best use of the changing winds, tacking and lowering sails, getting square on, in order to fire a broadside or getting close enough to board. What ship you have is important here. A galleon may offer you a lot of protection but you will find that other lighter ships will be able to run rings round you.

Obviously, if you sink a ship, you don't get too much chance to do some plundering as the trick is so damage her so much that she surrenders when you can close. Failing that, you will have to board her. A good captain always backs them to the front, and you must engage the enemy captain in a sword fight. How well you do reflects on the morale of the crew so it is important to hone your fencing skills.

You have a choice of three weapons - rapier, long sword and yellow. The yellow does most damage but you do have to be close to your opponent, whereas with the rapier, you can keep your man at long range but have to hit him an awful lot of times. All the long swords include throwing and slinking at high, mid and low levels. The slash does more damage if it connects but gives your opponent a lot more time to recover. If you win, the enemy captain goes down on his knees and surrenders his ship to you and of course, being a plunderer, you accept. Far be it from me to tell tales but the editor of this journal, and that he is still busy on hitting the enemy when they were at their knees begging for mercy.

As well as plundering a capture ship, you have the choice of sinking her or taking her along with you. Obviously, the latter action is better as you can increase your objective hold capacity and later sell the ship but make sure that you have enough crew to man both vessels.

Ships are not your only target - you can attack towns as well. This involves sailing your ship close enough to the town's fort before the enemy blows you out of the water. Your men can then land and you get to fight the Governor.

Alternatively, you can attack a town by land. This involves a completely different set of tactics. You have two or three groups of men to control as they attempt to make best use of the available terrain as you help the city's defenders into battle.

Naturally, you will want to capitulate on your ninth round walk, but remember that the crew want their share too. Sell into a friendly port, sell your goods and divide the

plunder. This will mark the end of a particular voyage and your crew will automatically disbanded. To keep your reputation high, it is important to have a lot of gold to give out so use this option sparingly.

Depending on your success, you get promoted by the various governors. Elevation in rank and a few acres of land all help add to your wealth and make for a huge retirement. You also get the chance to shut up the Governor's daughters with a view to finding yourself a wife.

Other events wander through the game. Your sister usually manages to get herself kidnapped and you have to find the man who did it and drag her magic leading to her whereabouts. There are also treasure maps to be brought and more algorithmic games to be found.

Not every cruise ends in success though. You may lose a battle and be imprisoned for as long as it takes for someone to decide that you are worth paying a ransom for. Losing a ship through carelessness and you will be stranded on some deserted island until a friendly ship happens to pass by. Eventually, the passage of time and the old wat'ers make take their toll and you are forced to write. At this point, your rating is worked out based on treasure, land and titles accumulated over the years.

The best thing about *Plunder* is that even though it is a game on a huge scale, it is very easy to get into - and by certain other simulations. There is no need to be aware of all the political implications at the beginning of the game.

although you will want to have an in order to maximize your profits. The game is simplicity itself to control and there are some nice graphics in the non-sailing scenarios. Documentation in the form of a users page book is excellent. My only reservation is that I am not sure how well the cassette version of the game will play as disk access is frequent.

Plunder is a superb simulation. It is difficult to think of anything else that could have been included. Occupied simply, it is only when you play for an extended period that you begin to recognize the subtlety of the tactics involved.

Adventure Kit

Want to write a gripping adventure? This series will provide a kit of machine code routines which will simplify the procedure and enable you to develop an individual style. We start off with the location/exits module.

As many of you know, there are a number of packages around which are aimed at making adventure writing easier. The best known are Quill and Graphic Adventure Creator. With these, all you need to do is think up the plot and the rest is done for you. The main drawback with these products however, is that the adventures written with them tend to have a similar feel and you are constrained by the imposed limitations of each package.

In contrast an adventure is a data base which is accessed during the game. The tedious part is the need for efficient and rapid access of the data held in it. This aspect will be tackled by this kit. This will leave you more time to work on the flow of the game and the addition of embellishments.

The kit comprises of six modules:

1. A location/exit module which allows the handling of the geography of the adventure.
2. A text module which handles messages, location descriptions, etc.

3. An object module which codes such actions as taking, dropping, saving, drinking objects, looking and inventory.

4. A parser allowing the input of commands and the checking of words against a vocabulary.

5. A window module allowing the manipulation of screen windows so that you can use or scroll different text areas.

6. An interrupt module which will build in a real time element into the game.

Naturally you don't get something for nothing. The machine code will need about 8K leaving you about 80K for BASIC. The routines will, however, give you instant access to 20K of memory for the game database.

Each module will be accompanied with an editor allowing you to set up the data base. However, I'll go through the setting up of an editor in sufficient detail to allow you to write your own.

Location Exit module

All adventures need some way of giving you the power to move about. This is done by using locations. Each location may be considered to be a room or cell linked to its neighbours by routes. It is necessary to specify two sets of data:

- a) which exits each location has;
- b) where each location leads to.

This month I will deal with the first set of data and cover the second set at a later date.

Ten possible exits are available for any given location. These are the eight basic compass directions and up and down. These are described in two bytes for each location. The first byte has a bit allocated for each compass bearing.

North occupies bit 0, north-east occupies bit 1 and so on. This information is held in a table of 256 bytes residing between 13612 and 13687 (09A00-09A7F). Location 0 uses the first byte in the table (136A2) and location 255 uses the last byte (13787). Up and down use the first two bits of

bytes stored in a table from 17688 to 18140 (88408-884FF). This works in the same way as the other table.

The destination data occupies rather more memory. Each location has two bytes reserved for it. These hold the number of the location reached when moving in any of the ten possible directions. If no such route exists, the byte value will be zero by default (more on that later). The table starts at 88500 (8144) and occupies as much memory as required by the number of locations used. If a full complement of 256 locations is used, the table will end at 88F00 (40704). Location 0 uses the first two bytes, location 1, the next two and so on.

The code in this module uses these tables to provide four functions. This routine prints the exits in any given location on the screen. The syntax of the command is:

```

SYS 3684,LOCNO,PRINTYPE,N,Y
LOCNO is the location number.
PRINTYPE specifies the form of the display. Type 0 prints the exits across the screen using commas to separate them.

```

Type 1 prints the exits in a column in a row variable for use in a window. X is the horizontal position of the top left corner of the output. It is ignored by type 0 output. Y is the vertical position of the output.

EXITCHK

This checks whether an exit exists. If there is not an exit, location 800 will contain a zero. If the exit does exist, it will contain 255. Its syntax is:

```

SYS 3687,LOCNO,DIRECTION

```

LOCNO is as before.

DIRECTION specifies the direction you want to move:

- 0...North
- 1...North-east
- 2...East
- 3...South-east
- 4...South
- 5...South-west
- 6...West
- 7...North-west
- 8...Up
- 9...Down

An example of its use would be:

```

800 SYS 3687,I,N,DH
810 IF PEEK(800)=0 THEN PRINT
"YOU CAN'T GO THAT WAY"

```

CHANGE

This allows you to create or remove an exit during the game. Its syntax is:

```

SYS 3679,LOCNO,DIRECTION,
ACTION

```

LOCNO and DIRECTION are as before.

ACTION specifies what will happen. A value of 0 shows the exit and a value of 1 removes an exit. An example of its use is:

```

3080 SYS 3679,I,I,I: PRINT "A
ROCKFALL SEALS THE
PASSAGE TEST"

```

CHECKST

This command checks the destination reached if you were to move in a specified direction. The number of the destination is held in location 901. The syntax of the command is:

```

SYS 3673,LOCNO,DIRECTION

```

The routine does not check whether an exit exists, you must do that. The following code fragment assumes that your current location is in LO and attempts to MOVE you in direction DI:

```

180 SYS 3687,I,N,DH
110 IF PEEK(901)=255 THEN
PRINT "YOU CAN'T GO THAT
WAY": RETURN
RETURN
120 SYS 3673,LO,DI: LO=PEEK
(901): RETURN

```

The code is provided as a normal BASIC loader but you will no doubt wish to save it as object code. For those of you with machine code monitors, save the block from 36800 to 3692E. The editor includes a small sorting routine which can be used for the job. What you do is:

- 1) RUN the editor and select the SAVE option.
- 2) When prompted for the file name, break out of the editor with RUN/STOP/RESTORE.
- 3) Give the command:

```

SYS 678 filename.1,3,16864,37586

```

if you are a disk user or

```

SYS 678 filename.1,2,16864,37586

```

for cassette.

The resulting code can be loaded directly by:

```

LOAD filename.1 or LOAD
filename.1

```

The editor is more direct and therefore self-explanatory. A few points should, however, be made.

The initialise tables option fills the data tables with zero bytes. Since the destination table is of variable size, you must specify the highest location to be used. This value is used to decide how much memory must be saved later. The program does not save the number of locations. You must remember it since you will be prompted for its value when you use the LOAD option.

The display location option lists the destination and exit entries for the specified location. The set up option allows you to specify the exits and destinations. You should set up the exits first. The destination portion will then ask you to specify the destination for each available exit.

If you plan to create an exit during the game, use the editor to create the exit and the destination and then use the editor to close the exit. The destination entry will be retained for when you need it.

The thing to remember is that you should plan everything on paper before using the editor. Changing data when once you've started work may not always be possible. The final code fragment pulls three of the commands together in a simple routine for moving about.

```

80 DATA NUM1,SE,SW,W,NW,
SE,LD
20 FOR I=0TO9:READDI:NEXT
DI:LO=I
40 PRINT CHR$(147):PRINT
"LOCATION"LO
50 SYS 3684,LO,0,I
60 INPUT "WHICH WAY"DI:I=0
70 IF DI=DI THEN GO
80 I=I+1: IF I=10 THEN GO
90 GOTO 40
800 SYS 3687,LO,I:IF PEEK(900)=0
THEN PRINT "YOU CAN'T GO
THAT WAY":GOTO 60
800 SYS 3673,LO:I:LO=PEEK(901):
GOTO 40

```

That's all for now, next time I will look at save storage.

PROGRAM: EXIT AND LOADER

```

20 8000 1000-10200:CB=0:CB0=00
210:RDRAW:CB=CB+9:FOR I=0TO9:

```

I.Q.

If you hate shooting aliens and feel that you need something more intellectual to stimulate your grey matter then look over this selection of games.

ULTIMA I

Anipone who has ever played the excellent Ultima III or even bigger and better Ultima IV will have wondered how it allowed. Playing these games is like watching a film that's already halfway through but now you can find out how it all began in this re-released version of the prequel, Ultima I.

There was once a land called Sosaria that prospered under the rule of Lord British. Unfortunately, there was also an evil Wizard called Mordulain who grew in power until he eventually invaded the land with an army of hideous

monsters that quickly crushed all resistance. Sosaria now desperately needs a hero to challenge the Wizard and free the land.

If you haven't already guessed you're the hero and you have to complete this quest on your own. As the game begins, you can define your character by assigning an extra 30 points to the existing values (but first decide your strength, aptly, stamina, charisma, wisdom and intelligence before choosing whether to be a human, elf, dwarf or halfling and if you're a fighter, thief, wizard or cleric). Once you've decided who and what you are, you head for the great outdoors and a familiar Ultima wilderness screen filled with towns, castles and dungeons. Enter one of these and the screen will change to show the rooms of the building.

Inside towns and castles you can buy food and drink to keep you alive, a room to sleep-off injury and exhaustion and shops to buy equipment and weapons to protect your quest.

As in the subsequent Ultima games you move around, fight and cast spells by pressing single key commands that are detailed on a quick reference guide. This is supplied in the display game box with the disk, booklet of spells and manuals, colour maps of the realm and a small bag of coins.

Ultima I has basic resolution and speeded up for this release and is a must for Ultima adventurers. You may find it a little easy after III and IV but it's still a challenging quest that will lead you to the stars (I'm not saying anymore, you'll have to find out the rest yourself). Coming soon Ultima II and then V!

ALTERNATIVE REALITY

Imagine all your worst nightmares joined together, and there is a fair chance that most of them will materialise in the Dungeon. Hidden somewhere beneath the City of Nebut's Densie you find yourself in the middle of a bitter conflict with evil godlike beings around you. Can you survive long enough to discover how you can turn this disaster to your advantage?

The Dungeon is the second scenario in Batesoff's *Alcatraz in Reality* series. It follows on from the City but you do not need to own this game in order to play. The story is that you have been kidnapped by an alien spacecraft. You find yourself in a room with only one exit which leads into an alternate reality.

As you leave the room, a panel of quickly rotating numbers flashes and your character statistics are generated.

These are strength, intelligence, wisdom, stamina, charm, skill, wealth and hit points. A high figure for hit points — the amount of damage that your body can sustain — is recommended. You will not have time to judge any of the other statistics. There are several other characteristics being mentioned that you are not told a lot, but most obviously as you go. Moral alignment and weapon proficiency would seem to be included.

As you start out, you find yourself by a shop and should take the opportunity to equip your character as best as your few silver pieces will allow with weapons, provisions and clothes. You can haggle for better prices but don't make too low an offer or you will be thrown out on your ear. A club is a useful first weapon.

As you wander down the corridors and explore rooms, it will not be long before you encounter someone or something. What happens next depends on who surprised who. You can try to transact with the creature, attack it or run away. Each of these options leads into a further menu of choices. For example, if you choose to attack, then you can offer something such as treasure, talk your way out of a fight, trick your opponent or just try to engage him in normal conversation.

The 'typical encounters' range include peasants, healers, thieves, mages, trolls and goblins (who are at war), the undead, dragons and devils. Remember that if you make a friend somewhere, the chances are that you have made an enemy somewhere else.

Doors lead off in all directions. Most open easily but some require brute strength, a key or the ability to break an enchantment before they yield. Just because you can't see them doesn't mean that they are not there. There are hundreds of secret doors and you will just have to keep walking into walls in order to find out where they are. Or you could use magic.

Magic comes in many guises. As you pass a guild if you can find one in the first place) you can learn the art of spell casting, for a hefty fee of course. Treasures gleaned from vanquished opponents often contain magical items. Potions, wands, runes, scrolls, trap-cards, magic eyes and hats all feature prominently.

Of course, not all treasure is good treasure. Quite a lot of it is cursed, and in which case you will need to repair your guild in order to have the curse removed. Other occupational hazards include catching diseases, being poisoned, getting hungry, thirsty or tired or suffering from extremes of temperature.

Although survival is your initial aim, as you progress, you find that there are various quests that you are undertaken. A prisoner wants rescuing, a golden apple needs delivering and you need to find two halves of a ring, bring them together and then destroy the ring in the fires of the sun.

The dungeon is displayed in 3-D with large illustrations representing special areas such as shops, guilds, the castle and so on. In size, the Dungeon is a third bigger than the City. Spread over four levels, level one is on a tilted grid with successive levels each being a quarter of the size of the one above. This means that accurate mapping is essential. A starter map is included and it is suggested that you photocopy this. Certainly, you will make many mistakes. I found whole areas that I just could not match up and it was not a case of being only one square out either. Teleports, one way doors and mazes only add to your problems.

The game is immensely playable, although expect to kill off a few characters until you get your bearings. One of the complaints levelled against the city was that disk management was very poor and this is something that has now been sorted out. My one grumble is that the save routine is a little clumsy. After saving, it would be nice to be able to resume straight away rather than having to reload the character, but I can live with that.

The descriptions above have only touched on a few of the features of the game. The Dungeon covers atmosphere and as such, must be one of the best role-playing games on the market today. If the next few instalments in the series are anywhere near as good, then fans of this type of game have a treat in store.

G.R.H.

Touchline

Title: Adventure/RPG — *The Dungeon*
Supplier: Strategy/CS Ltd, Unit 272 Halford Way,
 Halford, Birmingham B6 7AL, Tel: 021-358 1306
Machine: C64 — disk only, Price: £39.95

Value: 9/10

CONFLICTS I

There's a treat in store for wargame fans with the release of three of P&W's best known games on one compilation tape. The games are about as different in subject matter as it is possible to get — an air battle, an assault on an island and the defence of an entire continent.

Battle of Britain takes you back to 1940 as you try to pit the limited resources of the RAF against the might of the Hitler's Luftwaffe. The game can be played on three levels ranging from a training game to a fully blown thirty day campaign.

The display is a map of southern England and you are responsible for scrambling squadrons of Spitfires and Hurricanes to counteract the threats of the German fighters and bombers. Not every squadron is available to you as weather conditions play an important part of the game — airfields may be fog-bound. The problem is so get a squadron into the air, put it on a course where you think it will intercept the enemy and then after it has attacked, direct it to

land so that it can refuel and rearm. That is simple enough for one squadron but becomes a nightmare when you have eighteen to control, all in real time. There is an optional ascade sequence in which you sit in a Spitfire cockpit trying to shoot remaining Messerschmitts.

Theatre Europe was the game that brought fame and notoriety to PWS. Set in the rear lines, it simulates an attack by the Eastern block against the combined forces of NATO. The controversy was caused by the fact that you have a nuclear strike capability, either limited or full scale. These were heads of protest from the anti-nuclear brigade and the people who thought that all wargames encouraged bellicosity and ought to be banned. As is usual in these cases, everyone missed the point entirely.

Whichever side you play, it soon becomes apparent that using the nuclear option is a losing one, inasmuch that both sides escalate everything it becomes goodbye world as we know it. That said, there is still enough in this game to keep you thinking. You must keep your troops supplied, use your airborne forces to their best advantage and decide whether to use chemical weapons. All this on top of fighting a ground battle on a massive scale. There are seven different air missions that you can fly ranging from reconnaissance to attacking enemy supply units.

Patlands 82 has five different levels of play. You must decide where on the island you are going to land your forces and then you only have a limited amount of time in which to clear the island of Argentinean forces. Use one of your S&S and SBS forces for reconnoitering purposes should help you here.

Each unit has attack and defence factors, a movement allowance and attacking range. For example, a battery cannot move very far each turn but can attack from long range, whereas the Paras have to be next to their opponents before committing themselves to battle. After an attack, you may well, depending on conditions, be able to summon up an airstrike or request naval gunfire to help you. Time is limited, especially on the harder levels and the task of liberating all the settlements is no easy one, especially as you don't know the disposal of the enemy forces.

All three games are very well presented and easy to control, being by and large menu-driven. Whereas they lack the complexity of some fully blown wargames, they more than make up for it by being very easy to get into and retaining a high degree of playability. As such, they are highly recommended to beginners and newcomers of this fascinating art.

G.R.H.

Titleline:

Title: *Conflict*. **Supplier:** PWS. **Tel:** 0260 61554. **Machine:** C64. **Price:** £12.99 (incl. £7.99 tax). **Originality:** 5/7. **Playability:** 6/10. **Graphics:** 7/10. **Value:** 8/10.

STATIONFALL

Your career still hasn't developed the way that you envisaged when you joined the Stellar Patrol some five years ago. You started off as a fringe seventh class, sweeping the decks of space ships. Then, by some quirk of fate, and more than a little skill on your part, you manage to save a planet. Promotion came fast. You are now a lieutenant first-class but still the excitement promised in the glossy brochures when you joined the patrol is nowhere to be found.

Look at your present assignment. Help over to some remote space station and pick up a supply of Request for Stellar Patrol Issue Regulation Black Form Booklet Request Form. Hurdle the staff of which legends are made, is it? Your eyes light up a bit when you go to pick up your notes, as one of your three available choices is Floyd who insisted you so able when you rescued Residue Inc-detailed in Planetfall. He is delighted to see you again and begs to be picked. How could you refuse such an offer?

Completing the paperwork as quickly as possible (in triplicate of course) you set the autopilot in your spaceship and sit back until you arrive at the space station. You are a little surprised to find that there is no-one there to greet you. As you explore, you quickly discover that the entire station is deserted. Even Pluto, another robot that Floyd makes friends with is surprised to see you but isn't too sure why.

Wandering around the station, the only clue that you find is in a tape of the Captain's log which has entries about the arrival of a strange alien spaceship which seemed to coincide with a progressive series of malfunctions in every piece of technical equipment. Your worst fears are confirmed when you are attacked by a homeloid (hull repair droid).

As is usual with Infocom games, the story is lovingly crafted. It is impossible not to fall for Floyd, insurance that he is as he crumps up neatly behind you to show 'back' lovingly as you eat. The descriptions of locations and objects are wonderful and no-one has mastered the art of glossing the players' 'incorrect inputs' and answering them back in a similar vein - quite like Infocom.

That's parve though, over the wonder of adventures everywhere is beginning to look somewhat frayed round the edges, especially when compared to the likes of *Magnolia* or *Scrolls*. For example, a ph word like 'get the tape and examine it', won't work as the parser assumes that you are trying to get something called an 'examine'.

I can't say any adventure being disappointed, especially if they enjoy Planetfall. The packaging, which includes a set-in type, a set of the prints and your mission's instruction sheets, just helps to create the atmosphere of yet another excellent Infocom adventure.

G.R.H.

Titleline:

Title: *Stationfall*. **Supplier:** Infocom (UK) Division. **Tel:** 01-477 1777. **Machine:** C64-disk only. **Price:** £24.99. **Originality:** 5/7. **Graphics:** 7/10. **Playability:** 6/10. **Value:** 8/10.

79

Volume

This, unfortunately, has to be the same for all three voices, and if the control register is set at 15 then all three will be pumping out their notes at maximum volume. However, by using different waveforms and playing notes from different octaves, one can create the effect of different volumes for the different voices. A low note played using a triangle waveform will sound much quieter than a high note played using a sawtooth waveform, for example.

ADSR

These can be different for the three voices, and it is usually a good idea to make use of this fact when playing notes in harmony. Harshness effects are probably heard to their best effect when notes are sustained for a reasonable length of time, rather as one would expect on an organ, and so in our program to follow we'll be doing precisely that. Attack and decay rates, however, are probably best left up to the requirements of the individual voices.

Remembering that musical notation refers to notes as C, D, E, F, G, A, B and then back to C again, one octave further up, of course!

To produce a simple chord of C then, we'll take the following high and low value frequencies:

Note	Low Value	High Value	Frequency
C	24	2	256
E	163	2	678
G	15	3	800

From that you can probably work out the relationship between frequency and high and low values. Multiply the high value by 256 (more obvious) or the low value by 2 and add the result to the low value. This gives us the frequency value. So why are frequency values easier to work with? Well, if we wanted to play our chord in a higher octave, say the next octave up the scale, we would multiply the frequencies by 2; this is the relationship between notes in different octaves. To go up another octave then, we'd multiply the frequency by 2 again. It's a lot easier multiplying one

number by 2 than it is multiplying two numbers and trying to extrapolate a result from that!

So, having got the values, let's take a look at our program, bearing in mind that we're going to be using all three voices, and that the control registers that look after each voice come in blocks of seven. That is, if we use our variable $V=54272$, we'll see that the waveform for voice one is controlled by register $(V+4)$, for voice two by $(V+4+7)$ or $(V+11)$.

Waveforms

Once more we can make use of the facilities available with the SID chip and use different waveforms for each of the voices. However, the white noise waveform is not going to be an awful lot of use if we're going to be attempting to produce intricate, pleasant sounding harmonies, so for the purpose of this exercise we'll stick to just triangle, sawtooth or pulse.

Note Values

Fortunately all of these are worked out for you in the Commodore 64 manual, and as well as giving you the high value and low value frequencies for each note across some seven octaves, they also give you the value of the note in cycles per second. This is related to the frequency values in quite a simple fashion, but it can be of use to us, especially when lengthy notes or notes

voice three by $(V+4+7)$ or $(V+11)$. This enables us to set up a simple FOR ... NEXT loop to look after all three voices.

The Program

As before, we'll flash out the entire SID chip contents first before we start by setting the variable V and turning the volume on.

```

1 FOR I=0 TO 2:POKE I,54272+I,0:
NEXT I
10 V=54272
15 POKE V+24,15

```

So far so good, and exactly the same as before. Now let's set the ADSR sequence up for the three voices.

```

20 POKE V+5,2:POKE V+6,240
25 POKE V+12,4:POKE V+13,240
32 POKE V+19,15:POKE V+20,32

```

There is no great significance to any of these values, other than that we have used quite a long sustain and release for each one. Now to set the waveforms.

```

35 FOR I=0 TO 2:POKE V+I*7+
6:NEXT I
40 POKE V+4,17:POKE V+11
2:POKE V+18,65
47 POKE V+16,0:POKE V+17,255

```

The only difference now is that we're using different waveforms for all three, and that voice three is using the pulse waveform. Finally, we need to play the actual notes, like this:

```

50 POKE V+0,24:POKE V+1,2
55 POKE V+7,163:POKE V+8,2
62 POKE V+14,15:POKE V+15,32

```

The result is hopefully a pleasant sounding chord.

From here it is but a simple matter to play different chords in different keys. All you'll need to do is to look up the high and low values frequencies in the manual, and remember that chords tend to go in jumps of two notes at a time. That is, something like C, E, G as we've played here, or D, F, A for a chord of D, or G, B, D for a chord of G, and so on. You are welcome, of course, to experiment with dissonant

advanced programming methods are encountered.

When playing in harmony, it is probably best to stick to some straightforward rules. One doesn't have to be a Mozart to realise that C and C sharp when played in conjunction with D are not going to sound very harmonious. Consequently, in these early experiments we'll stick with playing some very simple chords. Simple, but they do produce a very pleasing result. We'll start with a very straightforward chord, played in the key of C, and using the notes of C, E and G for our three voices, and for

chords, if you can have such a thing, but remember that you might get on very well with your neighbours at the moment and that I won't be responsible for any untoward results.

Bearing in mind the techniques used here (and in particular the use of a FOR ... NEXT loop and the relationship between the three voices) it is but a simple step to go from notes and chords to proper tunes. There are many ways of extracting a tune from your Commodore 64, and in the next installment we'll take a look at some of the easiest methods.

Playing Tunes

Using the material that we've covered so far, there is really only one thing further that you need to know in order to be able to play some tunes on your Commodore 64 — the notes you're going to play.

Later on we'll be using a modified synthesiser program to do all this for us, but for now we'll stick to some very simple things that most people will either know before typing in or recognise when played. Having got as far as using three voices we will continue to use them, and we may as well stick to the waveforms and ADSR envelope shapes that we've already set up. So, our program begins like this:

```
5 FOR I=0 TO 24:POKE 5473+I:J
NEXT
10 V=54272
15 POKE V+24,J5
20 POKE V+52:POKE V+4,248
31 POKE V+119:POKE V+13,248
32 POKE V+19,23:POKE V+20,36
35 FOR I=0 TO 2:POKE V+I*7+40
:NEXT I
36 POKE V+4,27:POKE V+11, 35
POKE V+18,65
37:POKE V+36,0:POKE V+17,255
```

So far so good and so far, familiar. We won't yet carry on to include the three lines from the last section that actually played a chord, we'll consider what notes we are going to play first of all.

A familiar enough name to everybody must be the 'tunes' used in Close Encounters of the Third Kind when the aliens and humans finally establish some sort of communication

and produce a welter of sound and lighting effects that would do justice to an Electric Light Orchestra concert. The five all-important notes are D, E, C from one octave, and from an octave further down we have C and G. The five notes are played in that order, and since they also have more or less the same duration, we can concentrate on the notes for now and worry about the duration afterwards.

It really is about time to forget about high value and low value frequencies, and to turn permanently to true frequency values, or the number of cycles per second for each particular note. For the five notes in our Close Encounters theme, the frequency values are as follows:

```
100 DATA 1284,1350, 1432, 536,
800
300 DATA -1
```

The -1 data element in line 300 will serve to tell the program that we've run out of data and are not going to be playing any more notes. If we add the following lines to our main program, we'll be able to produce a simple tune:

```
30 READ #IF F=-1 THEN FOR
I=0 TO 24:POKE V+I*8+256
NEXT I
31 FH=INT(F/256):FL=F-FH*256
32 FOR I=0 TO 3
33 POKE V+I*7,FL:POKE
V+I*7+1,FH
34 NEXT I
35 GOTO 35
```

This, as you will soon realise, does not produce a very audible tune, and we do need to introduce some form of delay before going back to line 35 and getting the next note, a line something like line 35 would suffice for now:

```
35 FOR I=0 TO 100:NEXT I
```

A one second delay occurs between notes, but wouldn't it be better if we were to let the program produce the delay for us, rather than just having a one second delay all the time? Well, it's just one way of doing that:

```
100 DATA
1204,50,1350,50,1432,50,536,20,
885,100
```

and amending line 35 to read:

```
35 READ #IFOR I=1 TO
10:R*20:NEXT I
```

This gives us much more control over the duration of each of the notes, but it is still a long way from being really satisfactory. We can only achieve this through much trial and error, or removing the programming side of things altogether and letting the person running the program do the job. If we had our original line 100 back again which is

```
100 DATA 1204,1351 1432, 536, 800
```

we could insert yet another new line 35 to read:

```
35 GET #A$IF A$ < > " " THEN
35
```

In which case we would wait for the person running the program to pass the space bar before proceeding on to play the next note. However, this is still using alot of the 64's musical capabilities, and in order to make such notes play the note in a different key, we might have to make something like this:

```
31 FH=INT(F/256):FL=F-FH*256
32 FOR I=0 TO 2
33 POKE V+I*7,FL:POKE
V+I*7+1,FH
34 NEXT I
```

then:

```
31 FOR I=0 TO
2:R=I*21:LFH=INT(F/256):FL=F-
FH*256
32 REMARK is now redundant
33 POKE V+I*7,FL:POKE
V+I*7+1,LFH
34 NEXT I
```

Each voice now plays its note in a successively higher octave, the new frequency value being determined by the statement $F=F*2^{I+1}$ in line 31, since this will give us the value F on the first pass through the loop when I is equal to zero, $F*2$ when I is equal to one, and finally $F*4$ when I is equal to two. Raising two to the power of $I+1$ is a useful shortcut to producing the desired frequency.

But all this is concerned with producing single notes, albeit in different octaves. How might we go about producing a three-part harmony, still using our Close Encounters data and so more? For this we have to try and understand the relationship between individual notes, since we do not want to spend the rest of our days working out vast numbers of different frequency values.

Note to Note

We've already noticed that octaves are separated by a frequency value of two. That is, C in one octave has half the frequency of C in the next octave, a quarter that of C in the next octave again, and so on. Unfortunately for us there isn't a convenient number of notes from one C to the next, since there is only a gap of six notes between C_6 and seven notes (including the C itself) in total.

A simple, but not entirely satisfactory solution, would be to divide the difference between two octaves into sevenths, and use those values for our chords of D, E, C, C again and G for the Close Encounters theme. Alas as you'll discover if you try it out this does not work out exactly. Those little black notes have a habit of getting in the way.

Fortunately there is a mathematical expression for getting the frequency of the next note up the scale, provided you know the frequency of the preceding note, and it works like this. Assume that F is the frequency of the note, not yet converted into high and low values to be POKE'd into memory. Then, if we assign this to C , then the frequency of the note D in the same octave is found by the expression:

$$F \times \text{INT}(F * 2 / (1.059))$$

A rather complicated, but it does work! For example, the frequency of a particular C in a particular octave is

given as 1872 cycles per second. Applying this to our formula above gives us the new frequency of 1260. Not exactly the value given in the manual (which is 1284) but close enough, and those in the manual are never meant to be taken as gospel anyway.

To move more into the breach, and instead of spreading our three voices over different octaves, we'll now get them playing in harmony by introducing the following changes to the program:

```

31 FOR I=0 TO 2:IF I=0 THEN
  FH=INT(F/256):FL=F-
  FH*256:GOTO32
32 F=INT(F*2/(2+(I+1)*2+10))
33 POKE V+I*7,FL:POKE
  V+I*7+1,FH
34 NEXT I

```

Now doesn't that look wonderfully complicated? It's quite simple, really, don't panic! On the first pass through the loop nothing untoward happens, because we just want the original value of the frequency. Second time around, remembering that a chord of D will consist of the notes D, F, A, we want to be two notes higher up. In other words, replace the original (3/8) by (1/5), which, believe it or not, is what all the egomaniacs above do. On the final pass through the loop we want the frequency of the note that is four notes up from our original D, but since we cannot have (1/8) replaced by (3/5.5) we have to do everything in fractions of 12.

The main thing is that it works. Also a few of the variations on a theme that can be achieved by using just the first times. By playing in different octaves, or by producing chords, we begin to get some idea of the power behind the 64, but this isn't of course, the only method of playing tunes on the machine, and so for the rest of this particular section we'll be taking a look at one or two other examples of tune playing. After that, well, the light relief is over and we turn to theory in our attempts to get the most out of the SID chip.

Tuning up

Here's the first of just two different methods of playing simple tunes on the 64 from data statements, without any guidance at all, because you should be

getting familiar with the registers and their locations and functions by now. Play with them, embellish them, because it is only by doing that that you'll really begin to understand the workings of the SID.

```

35 V=54272
36 POKE V+24,15
37 POKE V+3,3
38 POKE V+4,8
39 POKE V+1,255
40 POKE V+1,20
41 POKE V+4,85
42 READ A,B,C
43 IF A < 1 THEN 200
44 POKE V+1,B
45 POKE V,C
46 FOR I=1 TO A*50:NEXT I
47 FOR I=0 TO 2:POKE
  V+I,8:NEXT
  I
48 GOTO 20
49 DATA
50,227,5,22,227,5,28,177,30,21,154
51 DATA 5,22,227,5,28,177
52 DATA
53,214,5,28,214,5,30,181,30,29,214
54 DATA 5,29,177,5,22,227
55 DATA
56,21,17,5,22,227,5,21,154,30,22,
  227,8,8
57 FOR I=0 TO 2:POKE
  V+I,8:NEXT I

```

One way of doing things you may (I hope) spot the 'tune' being played, which really no sound like Lionel Blair I suggest, but that's the only similarity between us, I assure you!

For our final example, here's a slightly different way of achieving the old sound effect or two:

```

35 V=54272
36 POKE V+24,15
37 POKE V+5,9:POKE
  V+12,3:POKE V+18,255
38 POKE V+6,8:POKE
  V+13,3:POKE V+20,70
39 POKE V+1,4:POKE V+30,15
40 POKE V+2,20:POKE V+9,20
41 POKE V+4,85:POKE
  V+11,128:POKE V+11,128
42 FOR I=0 TO 40:POKE
  V+11,POKE V+7,4:POKE
  V+13,3:NEXT I
43 A=A+18:IF A>150 THEN A=0
44 FOR I=0 TO 25:POKE
  V+18,NEXT I
45 GOTO 30
46 FOR I=0 TO 24:POKE
  54272+I,8:NEXT

```

Press the RUN/STOP key to get out of this one, and then enter GOTO 92 to start everything up.

There are many weird and wonderful sound effects that can be achieved by 'mucking' about with just the things that we've learnt about so far. Try altering the various parameters in this, and other programmes, to see what the effect might be.

When we start considering the more advanced techniques available to us on the 64, such as filtering, ring modulation, synchronisation, not only will we be able to start producing even more wonderful effects, but we will also be on the path to producing a true synthesiser, involving the simulation of different musical instruments, and much more besides. However, before we can talk about musical impression we need to know a great deal more about how various work, and in particular how different instruments produce the sound that they do.

Consequently, in the next section, we'll be looking in some detail at ADSR envelopes, and how changing them can produce a wide variety of different and unusual sounds and how, combined with a selection of different waveforms and one or two other parameters, we can really start to realise the potential of the 64 and its SID chip.

Attack Decay Sustain Release

In order to enhance the quality of any musical performances that we might achieve by using the Commodore 64, a thorough understanding of the envelope shape of a voice, or the ADSR setting is essential. The simple definitions that we have already given for the phrases Attack, Decay, Sustain and Release will tell us what they mean, but will not explain precisely how they operate. Consider the following program:

```

10 V=54272
20 POKE V+24,15
30 POKE V+40,POKE V+4,15
40 POKE V+50,POKE V+0,0
50 POKE V+1,RE,POKE V,10

```

This produces a note of a certain frequency playing using the sawtooth waveform, and having an Attack/Decay setting of nine combined with a Sustain/Release setting of zero. The note, as you will

hear, soon dies away to nothing. However, if we alter line 40 to read:

```
40 POKE V+3,15,POKE V+6,49
```

Now the note does not immediately die away, and indeed sounds rather different. A more substantial program should illustrate how the various settings of ADSR can be combined to produce some very different effects. Later on, we shall be looking at the workings of the two registers that control the entire envelope shape of the note (for voice only, they work in exactly the same way for voices two and three).

```

10 V=54272
15 FOR I=0 TO 24:POKE
V+LOANEXT I
20 POKE V+24,15
25 A=0:D=15:R=1:W=1
30 PRINT "CLR"
35 PRINT "ADSR"Attack Decay
Sustain Release "W/Form"
40PRINTTAB(40);TAB(11);TAB(40)
(1)R(2)A(3)S(4)T(5)A(6)B(7)W(8)I(9)
45 POKE 180,0
50 GET:A$=P$:""THEN$=0
55IF A$="A" THENA=A+1:IFA$=I
THEN A=0
60IFA$="D" THEND=D+1:IFD=I
THEN D=0
65IFA$="S" THENS=S+1:IFS=I
THEN S=0
70IFA$="R" THENR=R+1:IFR=I
THEN R=0
75IFA$="W" THENW=W+1:FW=I
THEN W=1
80 POKE V+3,A*16+D:POKE
V+6,S*16+R
85 POKE V+4,0:POKE
V+4,W*16+1:POKE V+2,0:POKE
V+5,49
90 POKE V+1,20:POKE V=0,20
95 GOTO 15

```

A fairly straightforward program, but it illustrates the point. After setting up the variable V the program then displays the current settings of Attack, Decay, Sustain and Release on the screen before waiting for the user to press a key. Pressing the 'A' key increases the attack setting, D the decay setting, S the sustain setting and R the release setting. Finally, pressing W changes the waveform, should you choose to do so.

The ADSR settings are POKE'd into place in line 80, before line 85 takes care of the waveform (and sets a low pulse frequency and a high pulse frequency, if required), before the note itself is at last played by line 90.

You might care to add to the program, so that different pulse frequencies can be selected, or different notes played. The changes are not too difficult, and since we've taken the precaution of having our line numbers increase in steps of five there's plenty of room for additional statements to be inserted if required. These will probably be along the lines of IF AS="something or other" THEN increase some variable. Not perhaps, the most elegant way of programming, but it will suffice for this simple example.

Now for a few words of explanation. You'll see that the waveforms are set to values of 1, 2, 4 or 8. By multiplying this by 16 and adding I we arrive at our most familiar values of 17, 33, 65 and 129.

You will note that the various ADSR settings cease progress beyond 16. This is because the two control registers that look after these settings are, obviously, dual purpose ones, and operate in this fashion:

```

A A A A D D D D
S S S S R R R R
128 64 0 0 0 0 0 0 0 0 0 0 0 0 0 0
0 0 0 0 0 0 0 0 0 0 0 0 0 0 0 0

```

In each case, the first four bits of each byte are used to control one setting, the second four bits of the other settings. To take the Attack/Decay register for now, since the Sustain/Release one works in exactly the same way, we will see that the maximum value of the Decay setting is actually 15, coming from the addition of (8+4+3+1). Several possible settings then, from 0 through to 15.

It might appear that the value of the Attack can vary from 0 to (128+64+32+16+8+4), covering math values as 48, 160, etc., on the way. However, adding all these combinations up gives us, yes, fifteen different settings, or sixteen if you include zero options. How much easier it is to think of settings ranging from 0 to 15 again (rather than 0 to 249 and obscure points in-between) and then multiply the real result by 16 to arrive at the higher value. If you check all the

WIN A FREE FLIGHT ON CONCORDE

The crew of B24, a superb combat and flight simulator based on one of World War II's most famous aircraft offering the pilot in a lifetime opportunity for you to win a free trip on Concorde, the world's most famous airliner.

By answering the simple questions below you could win a dream trip on the world's only supersonic passenger aircraft flying at speeds faster than the bullet from 2 gun.

CONCORDE... THE FACTS

- Concorde first flew on 3 March, 1969.
- Concorde has carried over 800,000 passengers over 50 million miles.
- Concorde holds the record for the fastest passenger flight London to New York in 2 hours 56 minutes on 7 January, 1985.
- Concorde's maximum level speed is 1,357 mph.
- Concorde carries a maximum of 128 passengers.

If you are not a lucky winner in this great competition, don't worry because you can still experience the thrill of flight plus the exhilaration of combat in B24.

B24

From the war torn skies of World War II emerged one legendary offensive weapon - the B24 Bomber. This superb simulation allows you to recreate the exploits of this great airplane on night mission runs on a 18 mission campaign to destroy oil refineries in Poland, Rumania.

As well, you control the mission flight on a bombing raid from your home base in Italy as group leader you command B24's on bomb runs to 10 targets dividing on when and where to bomb depending upon weather, plane availability, group efficiency and target oil production levels. A tight and combat simulation of unparalled quality.

Available on
CBM64/128
TAPE £14.99 DISK £19.99

ES, Gold Ltd., Units 13/14 Holford Way, Industrial Estate, Birmingham B4 7AZ, Tel: 011 221 2261

THE PRIZES

1st Prize: Two tickets for a flight on Concorde plus a copy of B24 and an SOI Order of World Player.

50 Runners Up Prizes: A copy of the superb flight and combat simulator B24.

Please state a preference as to tape or disk.

HOW TO ENTER

To win a supersonic flight on Concorde answer the following four questions and there is not more than fifteen words who you want to fly faster than the speed of sound. In the event of a tie, the most original reason will win the flight prize.

Please send entries to:

ES, Gold Ltd.,
 Units 13/14 Holford Way,
 Industrial Estate Birmingham B4 7AZ.

1. What is the speed of sound (mph)? _____
2. Name three World War II SOI titles. _____
3. What do the initials 'ES' stand for? _____
4. What is this? _____
5. (Don't more than fifteen words) I would like to fly faster than the speed of sound because _____

Name _____ Age _____
 Address _____

ES 125
 A simulation of a B-24 bomber in flight, this is a superb simulation of a combat mission. The game is designed to be played on a computer system with a keyboard and a mouse. The game is available on both CBM64 and CBM128. The game is a great way to experience the thrill of flight and combat in a B-24 bomber. The game is a great way to experience the thrill of flight and combat in a B-24 bomber. The game is a great way to experience the thrill of flight and combat in a B-24 bomber.

Link Up

Here is the chance to link up a short-wave technical receiver and Commodore 64 to a Transceive interface and multinode receive program.

By Evelyn Mills

Before going into the technical details of this versatile system, it is helpful to know a few basic facts about the receiver. Firstly, what receiver is required? The market is open here, with models ranging in price from \$24 to 1200. Regrettably the lower priced models will not function with interfaces/software of this type as certain basic criteria are required.

Your short-wave receiver should cover the range 1.8 - 30 MHz and it must have a detector to receive SSB (single side band) plus a CW filter for picking up Morse. To tune to an exact frequency, a receiver with digital display is much more accurate.

Price Range

Having said all this, how much do you have to pay for such a model? Looking around a second-hand market would be informative as there is a constant supply and demand. Our household model is a YAESU FRG700 which costs around \$200, second-hand. (Remember, that short-wave listening is a hobby, within itself which users get a great deal of information and pleasure from.)

An acceptable receiver will set you back a minimum of \$100 second-hand and should have all the above features including the facilities to use a good aerial and enable the receiver used here was worked on a long wire antenna (40 metres), suitably grounded to reduce background noise.

On to Computing

The interface, which is small and

compact, plugs into the rear port of the C64, and is connected to the audio output on the short wave receiver cables and connectors are supplied. It has a single switch which controls three functions; one position sets the computer for CW reception, another for RTTY reception and the third for filter on/off. According to the data you wish to receive, set the switch accordingly and load the disk. RX-8 program.

While the program is not lengthy, it is extremely compact and efficient in use. All of the commands function via a single key press, a list of which is given in the literature supplied. On loading, a status line is displayed at the bottom of the screen. Press B and this indicates that you are in RTTY (dot-type) mode; a C press takes you to Morse reception, an A press to AMTOR reception and a T press to download MCV (more screen selection scans). The AMTOR mode will not be discussed here as it is very similar to RTTY.

Our main options are T.R. and C. Inasmuch as Morse transmissions are received and translated with considerable facility, let's get into the C option first.

To do this, set the interface switch to CW then tune into the amateur bands available for Morse transmission, using the CW option on your receiver. These bands are listed in most short-wave handbooks and the more successful were found to be the 5.0-11.90 MHz and 14.0-14.590 MHz bands. The software controlling reception has a filter selection of 70

Hz, 150 Hz plus a filter OFF mode; these are displayed at the bottom of the screen and are selected with single computer keys. There are also single key controls for setting word speed. For amateur Morse, 20 w.p.m. or 40 w.p.m. should be used (depending on the speed of transmission). A speed setting capable of handling up to 250 w.p.m. is also available.

Let us assume that you have tuned into a good, clear Morse transmission. At the top left-hand corner of your screen, nothing is visible until tuning is perfect, at which point a flashing yellow cursor will appear and the Morse transmission will now be translated to text on your screen in English or the appropriate language - such conversations are regarded as confidential and may not be printed here. You will find the transmitter's call-sign printed out, eventually enabling you to locate his/her geographical position (with reference to handbooks).

It should be remembered that many people use Morse in an abbreviated form or even in coded form; furthermore you are just as likely to catch the end of a conversation as the beginning. In fact, what you pick up is a matter of trial, error and chance! The transmission may be 'tucked' on an airlock if need be.

During reception, when one screen is full, it is overwritten by subsequent data which allows fast decoding. All material can be saved to disk by pressing S - a beep will be heard which should be followed by a single number

Sprite Grabber

Want to use sprites from other programmes in your own games? This utility makes it easy for you to find and save them for later use.

By J. MacDonald

Sprite Grabber is a useful utility for examining the sprites used in games. The sprites once found can be **SAVED** to disk or tape, **LOADED** back into some form of sprite editor and changed at will. In this way you can build up a library of your favourite sprites from your favourite programs.

Getting it in

Sprite Grabber is a machine code program, presented here as two Basic Loaders. These should be typed in using the SYNTAX CHECKER program that can be found on the LISTINGS page.

Why two versions of the program? It's simply that they are both located at different addresses, in case one happens to sit in the same area of memory as the sprites you want to grab.

When the loaders have been RUN I suggest that you **SAVE** the machine code using a monitor or one of the following small Basic programs:

For the version at address 49152:

10 POKE 43, 0: POKE 44, 192

20 POKE 45, 190: POKE 46, 25

For the version at address 16044:

10 POKE 43, 0: POKE 44, 64

20 POKE 45, 70: POKE 46, 64

Then **SAVE** the programs with:

SAVE "SPRITE GRABBER", X, 1
...where X is 1 if using tape or 0 if using disk.

The programs should be **LOADED** back in the address from where they were **SAVED** to avoid corrupting any sprite data that may sit in the Basic area. You do this with the following command:

LOAD "SPRITE GRABBER", X, 1
...where X is as before.

Using the program

LOAD in the game with the sprites that you wish to examine. Once **LOADED** and **RUNNING** reset the computer using a reset switch, or a cartridge with a reset on it. **LOAD** the **SPRITE GRABBER** program into memory at the address of your choice (49152 or 16044) and run the program with:

SYS start address

...where the start address is either 49152 or 16044 depending on the version of the program that you choose to use.

A menu will now appear on the screen showing what the function keys do. 'R' and 'S' options and sprite information at the bottom.

The function keys will allow the sprite pointer to be increased or decreased by one, sprite colours to be

changed, toggling between multicolour and hi-res mode and toggling the XY expansion of the sprite. **BANK** switching is achieved by pressing numbers 0-9 as shown on the screen. At all times the sprite pointer, **BANK** and sprite address is displayed on the screen.

If you find a series of sprites that you like, which might be an animation, like a man walking, use **F1** to display the first sprite in the series, and then press 'W' to save the start pointer. Now use **F1** to move the sprite pointer to the last sprite you want to save and press 'W' again to indicate the end of the series. Pressing 'W' will now activate the **SAVE** section of the program. This will prompt you for Tape or Disk — press the appropriate letter and you will be asked for a filename (80 characters max). Your series of sprites will now be **SAVED**.

If you try to **SAVE** from a high to a low address you will be notified of an error — press any key to try again.

Sprites can be **SAVED** from anywhere in memory, including under the ROMs. So remember, unless you are loading the sprites from a program which will redirect them to a new address, they will **LOAD** into the area they originally came from — with possibly unforeseen results.

Hook-Ups

Continuing our series, we look at the possibilities of using the BBC as an intelligent disk drive interface between the C64 and itself.

By Mycroft Appleby

Last month I explained the general principals of parallel communications, the terminology, and the method that I was going to use in the series. Also I included as an example, a simple memory transfer program for the C64 and BBC micro.

This month I'll look at a more practical application of the system. If there are two things that are different in the C64 and BBC Micro it is speed, and more specifically disk speed. The BBC Micro has one of the fastest and cheapest disk systems on any home micro. The Commodore 64 on the other hand doesn't have disk drives at all. Oh, they may look like disk drives. But in reality there are little hamsters inside that disk drive shaped box, that listen to the information coming down the serial bus and scratch it on the surface of the disk in shorthand.

This breed of hamster is very rare and was bred specifically by Commodore for the link. One of the stranger things about this breed (Hamsterus Floppus) is that they live on the paper envelopes that disks usually come in. If you don't believe me, count the number of disks that you've got, then count the number of envelopes - see! Further proof is evident when you swap disks in the middle of a "read or write" operation. The miniature hamster hammer on the roof of the box to get you to stop.

So with those two things in mind, it should be possible to use the BBC Micro as an intelligent disk drive interface between the C64 and the BBC Disk Drive, all you need is some clever software and the appropriate transmission protocol.

There is a small Basic program in the C64 and the main program on the BBC Micro. This is for two main reasons. Firstly you can load 1K of data into a BBC Micro and then port it onto a C64 a lot faster problems that

you get with Basic getting confused with machine code. The second reason is that this series isn't designed to give complete solutions to problems, but rather to supply the tools and the information to do the job. For this the code must be in Assembly format rather than strings of hex digits, so that you can see how it works. Most C64 assemblers are incompatible with each other and interfere with the system to such a degree that once the assembler has taken a chunk out of the memory map and written all over the printers you haven't a clue where you are.

So the program is in the standard BBC format assembler. The C64 host program is only slightly different from the one published last month, only locations and amounts have been changed. Some of the code on the BBC side may also be familiar, as I used many of the principals which were discussed last month.

Starting Up

To load the software into both machines, first load "Basic" into the Commodore 64 and load "Disk" into the BBC Micro. Run "Basic" and then run "Disk". After about 30 seconds the code will have assembled into the BBC, been transferred to the C64 and then the BBC side will have been re-assembled and initialized by the BBC.

On the BBC screen at this point you will see a message indicating the buffer size and a number. This is the number of bytes in the buffer and indicates the maximum program size you can load on size plus 256 bytes for the header packet (which I've explained later). Do not exceed this. To increase the buffer size, most of the error checking has been removed.

On the C64 side you should have returned to the "Ready." prompt.

Typing SYS 49137 in the first coloured way will initialize the system.

At this point the vectors inside the machine that handle the loading and saving will have been slightly altered. Tape and disk (if appropriate) will work as normal, as will all other device addresses except 'F'. This will transfer your program onto the BBC's currently selected drive in the blink of an eye. Likewise loading with a device number of 'F' will load from the disk into memory as normal. Verifying is not possible however, due to the "burst" transmission of the data (i.e. the data goes back and forth in one great chunk and it is difficult to compare it on a "byte for byte" basis).

Alterations

If you have a disk drive already attached and want to use it also, then you can change the device number of the BBC very simply. In the sections 'BLOAD' and 'BSAVE' in the C64 half of the program you will see that the memory location 'device' is compared to 'disk'. This is the device number. Change this to whatever number you want above three (the system's choice, not mine) and you are there. A good choice (and one I use myself) is seven as not a great deal seems to use this device number.

How it works

Remember how last month in the header packet of the transmitted data, as well as where to and how long, the packet also had a byte called 'cmd'. Well, this is the command byte. In this new system when the data comes flooding into the BBC, it looks at this byte and if it is a one it knows to save the data. The first 256 bytes of the data is special and holds various

information about the data, including the name it is to be saved under. This is restricted and the data is saved.

If the cmd number is two, this then is a load request. In this case only the 256 byte header packet is sent, complete with various information about the program, as well as its name again. The C64 then just sits there and waits. In this program it doesn't return to Basic, but you can have it so you get full Basic control right away and the program just appears in memory when it's ready. This system works well but needs a lot of care to operate it. 'Loop' is the area to watch. Change the finishing off to operate in the BQ loop and perform a manual rethink and you are away - parallel processing at last.

However, back to the plot. When the BBC has found the program on disk, it prepares a packet with cmd of three and sends it to the C64. The C64 knows that three means 'incoming program data' and treats it accordingly.

A cmd of zero will force a memory dump in any direction, just follow the instructions for last month. This is amazing for swapping errors and messages, or changing subroutines character set.

Protocols

The transfer packet looks like this:
data to /
data hi / Address where data is going.
len to / Length of data.
len hi /

cmd Command Byte.
The program packet (first 256 bytes) looks like this:

Header	Name	Function
0	or	Secondary address
1	drive	Secondary drive (optional)
2-3	name	Filename
4-5	start	Origin start address of program
6-7	end	Origin end address of program
8-15	len	Reserved for future expansion

Next Time

I hope this system is of some use. I can't abide my hardware drives any more, the BBC drive is so much faster. Next installment I'll see what else I can dream up.

PROGRAM - BQBT

```

Rebound

A superb breakout style game for C16 and Plus/4 owners.

By K.M. Lawrence

It's funny how the old favourites like space invaders and breakout are still extremely popular with computer owners.

To play the game LOAD the program "REBOUND" and RUN it. This will automatically LOAD and RUN the machine code section of the program.

Use a joystick in port one to move your bat and hold down the fire button to make the bat move faster. But be careful - you have limited power to do this.

When you hit a brick it may turn into a "monster" and flash. From this state the brick may return to normal or it may change into a brick that will affect your bat in strange ways. The possibilities are small but, reverse controls or hit ball. The latter lasts until you hit the ball again while the others last for a certain length of time.

It is possible that when you hit a brick, a white dot may fall towards you. If you catch this you get the chance of using one of the various options that will appear on the right of the

screen. Pull the joystick down to choose the option that you want, but remember, the more dots that you collect the better the option that is given to you.

Options Available

- Power - Extra power to go fast.
- Clear - Gets rid of small bat etc.
- Exit - Go to next level.
- XBALL - Up to three balls on screen, push up to release.
- XLIFE - Up to 255.
- Wall - Places a wall behind you so that balls will not be lost.

When the game starts the screens are set in random order. Press RETURN while on the title screen to play the screens in sequence.

Getting it all in

Rebound consists of two programmes. The first, REBOUND, is in Basic and should be typed into your machine in the normal way and then SAVED to disk or cassette.

The second program, REBOUND M/C, needs to be entered through three computers in bank monitor. To enter the monitor type MONITOR, type M 0000 to start entering the program. You will now be able to enter each line of the listing over the existing contents of the computer. You must press RETURN to enter each line of machine code. If you

have never used the MONITOR, read the relevant section in your computer's manual and be sure that you understand what you're doing before entering the program.

It is important to note that your typing must be very accurate. The slightest typing error will cause the program not to work.

When you have entered all of the REBOUND M/C program you should SAVE it to disk or tape by using the following command:

S "REBOUND M/C" M,1000,3400.

If using disk change the 01 to 08. Cassette users should SAVE REBOUND M/C after the program.

POOLSWINNER™

THE ULTIMATE POOL-PRODUCTION PROGRAM

- **MASSIVE DATABASE** - Produces up to 100,000 letters from 100,000 names in under 10 minutes.

Software for Sale

If you think that one of our programmes looks very interesting, but you can't afford the time to type it in then our software service will help you out.

It's three o'clock in the morning. You sit at the computer keyboard just finished a marathon typing session and your fingers reach for the keyboard and press the letters R, U and N. You press RETURN, sit back and nothing happens.

Everyone has probably faced this problem. When it does happen it's a matter of spending hours searching through the program for any typing mistakes. No matter how long you look or how many people help you, you can usually guarantee that at least one little bug slips through unnoticed.

The Year-Commodore Software Service makes available all of the programmes from each issue on both cassette and disk at a price of \$6.00 for disk and \$4.00 for cassette. None of the documentation for the programmes is supplied with the software since it is all available in the relevant magazine. Should you not have the magazine then back issues are available from the following address:

INFONET LTD, 3 River Park Drive, Berthamstead,
Hants HP4 6HL.
TEL: (0447) 768174.

please contact this address for prices and availability.

The Disk

Programmes on the disk will also be supplied as totally working versions, i.e. when possible we will not use Basic Loaders thus making use of the programmes much easier. Unfortunately at the moment we cannot duplicate C16 and Plus/4 cassettes. However programmes for these machines will be available on the disk.

What programmes are available?

At the top of each article you will find a strap containing the article type, C64 Program etc. So that you can see which programmes are available on which format you will also find a couple of symbols after this strap. The symbols have the following meaning:

This symbol means that the program is available on cassette.

These programs are available on disk.

Please Note

Since the programs supplied on cassettes are total working versions of the program, we do not put disk-only programmes on tape. There is no sense in playing a program that expects to be reading from disk on to tape. 

MAY 1987

LOWER CASE GRAPHICS - Using lower case text on your C16 and Plus/4 graphics screen. (On disk only.)

C16 CHARACTER EDITOR - A powerful character editor for the C16 and Plus/4. (On disk only.)

EVERYMAN'S GUIDE TO GRAPHICS - All of the programmes from this fascinating article.

C64 SPRITE EDITOR - A comprehensive sprite editor for the C64. Available for both disk and tape.

CREDIT 64 - A character editor with no fewer than 44 different commands. (Available for tape and disk.)

ORDER CODE

DISK YDMAY87 \$6.00 TAPE YCMAY87 \$4.00

Tech Troubles

If you have any technical problems, write to our agency uncle, Tim Arnot who will do his best to help.

By Tim Arnot

Dear Tim,

I have a Commodore 128 and 1571 disk drive. After what I've heard recently, just how safe is it to use the back of the disk, especially with programmes like Superbase?
Raymond North, Blackpool.

Hi Raymond,

The 1571 has certainly received its fair share of criticism over the past few months. In essence, the problem with it, is that under certain circumstances, files that use the second side of the disk can become trashed. This trashing will ONLY occur under the following specific conditions:

Either one Relative file and one Sequential file is open or three Sequential files are open. Of course, one of those files must be on side one!

What happens to your newly opened file on side two is basically this. After 1600 or so bytes have been written to the file, corruption of data WILL occur. The resulting file will contain only up to seven blocks of data regardless of how much was written. If you then COLLECT (validate) the disk, the block count no longer adds up to 1528.

ICPLUG member Greg Perry from Australia recently provided the following program which demonstrates the problem.

PROGRAM: 1571.DSK.DEMO

```
100 REM *** DEMO OF 1571 DSK DEM ***
110 REM *** CREATE RELATIVE FILE ***
120 TO FILE SIDE 2 ***
130 OPEN "WASH FILE",LPT0:CLOSE
140 GOTO 100
```

```
150 PRINT "PLEASE WAIT - CREATING
  0 RELATIVE FILE"
160 POSITION:CLOSE:REM:REM POSITION:
  0 RECORD
170 PRINTING "END RECORD"
180 REM *** WRITE SOME RECORDS TO
  0 FILE ***
190 FOR I=1 TO 50
200 PRINT "WRITING RECORD #",I:
100:CLOSE:REM:REM POSITION:RECORD
  0
210 PRINTING "THIS IS RECORD #",I:
  0
220 NEXT I:GOTO 100
230 REM *** CORRUPTION OF DSK
  0 ***
240 OPEN "END FILE SIDE 2"
  0:IF I=50:THEN:CLOSE:REPOSITION:
  "WASH":CLOSE:REM:REM:
250 OPEN "WASH FILE"
260 FOR I=1 TO 50
270 PRINT "WRITING RECORD #",I:
280:CLOSE:REM:REM POSITION:RECORD
  0
290 REM *** READ FROM REL. FILE &
  00 WRITE TO SEQ. FILE ***
300 INPUT "AN:PROGRAM"
310 PRINTING "THIS IS A COPY OF A
  RECORD #",I:
320 NEXT I:GOTO 100
330 REM *** READ BACK THE FILE
  00 & CHECKER ***
340 OPEN "END FILE SIDE 2"
  0:FOR I=1 TO 50:IF I=1:GOTO:1:1:1
350 INPUT "AN:PROGRAM"
360:CLOSE:CLOSE:END
370 REM *** POSITION RELATIVE FILE
  0 ***
380:RECORDS:160:CLOSE:REM
  00:RECORDS:160:1
390 REM *** CHECK DSK ERROR ***
400:IF I=50:OR I=50:THEN:REM:
  0
410 PRINT "DSK ERROR":REM
  00:CLOSE:END
```

Run the program on a newly formatted disk. A relative file is set up, filling all of side one and part of side two. The first 40 records are then written. To demonstrate the bug, we open a Sequential file and copy the contents of the first 40 records into it. The resulting file is corrupt. You will see that most of the information we copied is missing. If you COPY "WASHFILE SIDE 2" TO "AND-

THIS", you will see something curious - the file is now only two blocks long!

This problem will occur with Superbase, and any other application that has more than one file open at once. Program loading and saving is perfectly alright, as there is only one file open. Keeping to side one is also perfectly safe.

There are new ROMs on the way, but they have been held up by the release of the new 128D Commodore should be able to supply them 'real soon now's), so if in doubt, hassle them. The cost is yet to be announced.

Dear Tim,

I own an old 40K PET and 400K disk drive. I recently bought a Plus/4 and 1571 disk drive. My problem is this. If I save a program on the PET, I can load it on the Plus/4, but if I save it on the Plus/4, I can't load it back on the PET. Can you help me?

James McHenry, Aberdeen.

Hi James,

The reason for this is that the LOAD command behaves slightly differently on the PET compared with the later Commodore computers. On the Plus/4 (or C64, C128 etc), when you type LOAD "ANYPROG", if the program is loaded into memory, starting at a place known as the 'start of basic'. This is the place where Basic programmes are stored, and it varies from machine to machine. For instance, on the PET it is \$0401, on the 64 it is \$0801, the 128 is \$1C01, and on the Plus/4 it is \$0011.

Additionally, the 128 and Plus/4

Checksum Program

The hexadecimal numbers appearing in a column to the left of the listing should not be typed in with the program. These are merely checksum values and are there to help you get each line right. Don't worry if you don't understand the hexadecimal system, as long as you can compare two characters on the screen with the corresponding two characters in the magazine you can use our line-checking program.

Type in the Checksum Program, make sure that you've not made any mistakes and save it to tape or disk

immediately because it will be used with most of the programs and listings appearing in *Your Commodore*.

At the start of each programming session, load Checksum and run it. The screen will turn brown with yellow characters and each time you type in a line and press the RETURN key a number will appear on the screen in white. This should be the same as the corresponding value in the magazine.

If the two values don't relate to one another, you have not copied the line exactly as printed so go back and check each character carefully. When you find the error simply correct it and

press RETURN again.

If you want to turn off the checker simply type SYS49153 and the screen will return to the familiar blue-colour. You can then do whatever it was you wanted to do and if this doesn't end the area where Checksum lies you can go back to it with the same SYS command.

No system is foolproof but the chances of two errors cancelling one another out are so remote that we believe our listings are more reliable than any other magazine in the world. So get typing! 21

WARNING NOTICE

Advertisements placed in this magazine are to be in strict compliance with our standard conditions (copies of which are available on request) and on the clear understanding that the advertiser warrants that his advertisement(s) does not infringe any copyright or constitute a sale of any interested party in the advertised product. Further, the advertiser indemnifies the proprietors of this magazine in respect of costs, damages, or any other claims brought against them as a result of legal action arising from the publication of the advertisement(s). Any breach of these terms or of the said conditions may result in prosecution of the advertiser by the proprietors.

B H E A H

C64 Sprite

There are no problems with this program as printed. A number of people have queried how they should enter the [255] statements that appear in some of the lines of the DEMO program. When our printer can't reproduce a Commodore graphic, either a mnemonic such as [LEFT] is printed on the code of the character is printed in the code of the character is printed within square brackets. In this case the character should be looked up in your manual and entered. In the case of the [255] character that should be entered is the P1 figure (8).

Software for Sale
Important Notice

A number of people have reported an error when LOADING drawings that have been SAVED using the TIC DRAW 84 program.

It appears that a master copy became corrupted and has caused these problems.

Should your copy of the program suffer from this problem please return your disk to:

OMEGA MICRO SERVICES
7 GRAHAM AVENUE
BRINSWORTH
ROTHESHAM
S80 5LA.

and a new disk will be sent by return post. Sorry for any inconvenience caused.

Apologies are also due to people who experienced delays with software ordered in late June/early July. Unfortunately, problems were caused by problems with the postal service within London.

FBI

Are you a winner in the Exploding FBI competition from April 1987? Read on and find out.

Bug Finder

We'd like to remind our readers that we run a Bug Finder service.

If you have typed in one of our programmes and despite much checking, you still can't get it to run, then send us the following:

Two copies of your program on tape or disk.

A description of your problem. If possible a listing of your work (you may omit this).

A stamped, self-addressed envelope for return of the program to you.

Should any of the above be missing

then we will not be able to deal with your query.

We will try to point out where you have made errors and place a corrected copy of the program back on to your tape or disk before we return it to you.

Do not send a program to us as soon as it stops working, please check a several times first.

We do get a large number of queries and so it may take a while for us to deal with yours personally.

Notice can only deal with problems relating to programmes published in *Four Commodore*.

You won't find these programs in the top ten!

These programs have sold thousands of copies, and yet you won't have seen them in the charts — why?

We produce programs that you can really get your teeth into. Programs like **MUSIC MASTER** and **BASICALC 3** which can be used at home or in the office to do all sorts of calculations, forecasts and budgets.

Programs like **MICRO ASSEMBLER** and the **CCOM** monitor which make it easy to write machine code programs. Programs like **MUSIC MASTER** which turn your computer into a musical instrument, and programs like the **BLITZ** compiler which makes ordinary BASIC programs run much, much faster.

We have been writing programs for Commodore computers since 1979 and now have hundreds of programs for the PET, VIC 20, CBM 64, CBM 128, even the C16 and Plus4. So why aren't our programs in the charts?

Because our programs aren't one minute wonders, here today and gone tomorrow. Programs we released for the 64 in 1980 are still selling — and even more important, the people who bought them then are still using them.

Software should be an investment, not money down the drain. We believe that the more you put into a program, the more you should get out of it, and that's the way it works with software from **SUPERSOFT**.

The programs listed on the right represent a small selection from our range, but you can get a full list if you phone or write to the address below. We offer an excellent mail order service, and you can pay by cheque, Access, or Visa.

**SUPERSOFT, Winchester House,
Canning Road, Waltham, Harrow,
