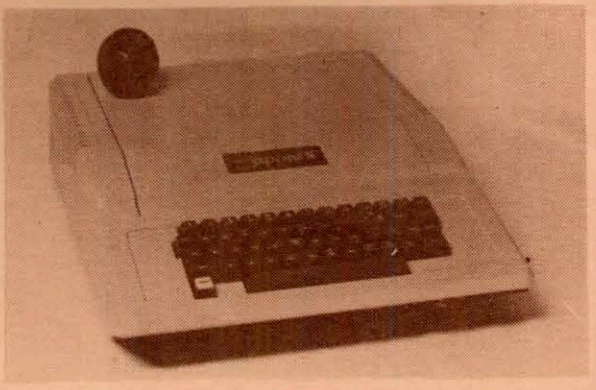
16K APPLE II $1195.00



- We are Apple Headquarters. Buy from us and let us help you get the most from your Apple.
- Free software with purchase of Apple. Choose up to $100.00 worth of software from over 100 selections in our Apple software catalog.
- Our unique Apple II software catalog gives a short critique on each program so that you know what you are buying before you buy.
- We also have numerous selections of software free with any purchase.
- We offer service contracts for all equipment we sell.
- We provide demonstrations and orientation services for schools and businesses anywhere in Los Angeles or Orange Counties, California. Call for information regarding this free service.

8K COMMODORE PET ... $795.00

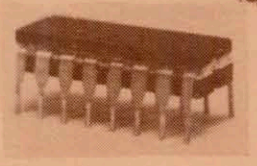
- FREE ..... $ 50.00 worth of software of your choice with each pet.
- Software .... Over 50 programs now available and still growing. Send for our software catalog.
- In Stock ..... Off the shelf deliveries
- Service ..... We have an on site service department.
- Users group now forming

BLANK CASSETTES

C-10 BLANK CASSETTES (W/O BOX) FOR MICRO COMPUTING.

$ 1.00 Ea.	Other lengths will be available in the future.
$ 7.50 for 10	Call or write for quotes on larger quantities.
$32.50 for 50	Add 10% (minimum $2.00) for shipping and handling.

16K RAM FOR APPLE II



- 4116 Chips. 8 per set makes 16K RAM. Just any 4116 chips will not work in the Apple II. 350NS or slower will not work properly. 250NS chips are adequate. 200NS chips are preferable.
- 200NS chips. Tested and guaranteed ..... $ 95.00 per set.
- Add $ 2.00 for shipping and handling.

QUANT.	ITEM	PRICE	ABOVE ITEMS ARE NORMAL STOCK ITEMS. DUE TO CIRCUMSTANCES BEYOND OUR CONTROL, WE ARE SOMETIMES TEMPORARILY OUT OF STOCK. PLEASE CHECK APPROPRIATE BOX BELOW.
			CERTIFIED CHECK, MONEY ORDER, VISA OR MASTER CHARGE ORDERS SHIPPED SAME DAY. NO COD. ALLOW 2 WEEKS FOR PERSONAL CHECK TO CLEAR.
CALIFORNIA RESIDENTS, ADD 6% SALES TAX			PLEASE BACK ORDER IF OUT OF STOCK ☐ DO NOT BACK ORDER IF OUT OF STOCK ☐
SHIPPING & HANDLING. ADD $10.00 FOR COMPUTER SYSTEM.			IF USING CREDIT CARD, CHECK BOX AND ENTER CARD NUMBER BELOW.

PERFECT AIM

ATTRACTIVE FUNCTIONAL PACKAGING FOR YOUR AIM-65 MICROCOMPUTER

- Professional Appearance
- Striking Grey and Black Color Combination
- Protects Vital Components

ENGINEERED SPECIFICALLY FOR THE ROCKWELL AIM-65

- All Switches Accessible
- Integral Reset Button Actuator
- Easy Paper Tape Replacement

MADE OF HIGH IMPACT STRENGTH THERMOFORMED PLASTIC

- Kydex 100*
- Durable
- Molded-In Color
- Non-Conductive

EASILY ASSEMBLED

- Absolutely No Alteration of AIM-65 Required
- All Fasteners Provided
- Goes Together in Minutes

AVAILABLE FROM STOCK

- Allow Three to Four Weeks for Processing and Delivery
- No COD's Please
- Dealer Inquiries Invited

Patent Applied For

IN THIS ISSUE ...

Andrew V. W. Sensicle increases the power of the basic KIM-1 with "EKIM OR MAXI-KIM", a small, page 17 monitor extension. This supports a PC "decrement" to compliment the normal "increment" function, "open up" and "close up" modes to move blocks of data to make room for adding code, and a "branch" calculator which simplifies determining the relative branch addresses.

Robert A. Stein, Jr. provides "A CASSETTE OPERATING SYSTEM FOR THE APPLE II" which makes it possible to maintain a library of programs which can be loaded by name from cassette. The article includes a cassette control circuit as well as the programs in assembler and BASIC to run the system.

Alan G. Hill presents "AN APPLE II PROGRAM EDIT AID" which helps the user locate all occurences of any variable name, character string, or BASIC statement. The article includes a short assembler level program and a BASIC demo program.

J. Stelly makes it a lot easier to use the game of LIFE on your PET with his "LIFESAVER". This program supports creating a LIFE pattern, running LIFE at various rates, and saving and loading LIFE patterns on cassette.

Nicholas J. Vrtis helps overcome the SYM-1's KIM tape "2F" problem with a "CORRECTED KIM tape "2F" problem with a "CORRECTED KIM FORMAT LOADER FOR SYM-1". This program is carefully written with an interesting "trick" so that it does not itself contain a "2F" even though it must test for this troublesome character.

Bruce Hoyt comes through with a lot of good info on the OSI with "A CLOSE LOOK AT THE SUPERBOARD II". In addition to an overview, he presents a cassette save/hex memory dump program and a very useful table of memory usage.

Robert M. Tripp continues "ASK THE DOCTOR", a series on the AIM/SYM/KIM family of microcomputers, with a "Corrected AIM Sync Program", a "Patch for the AIM Disassembler", a "SYM Tape Evaluation", and "Comments on Synertek BASIC". Most of the info in this month's section has been provided by other ASK users.

"THE MICRO SOFTWARE CATALOG" continues with ten new entries.

John Gieryic has a tutorial article on a "SYM 6522-BASED TIMER" that gives insight into the workings of the 6522 VIA as well as the SYM.

Edward Chalfin has "THE TVT-6: A USER'S REPORT" which give his experiences and impressions of Don Lancaster's inexpensive method of getting a video signal out of a KIM-1.

William R. Dial continues to cover the expanding 6502 literature in his "6502 BIBLIOGRAPHY".

Don Rindsberg presents a major program in "THE ULTIMATE PET RENUMBER". This complete program can be used to rapidly renumber BASIC programs. The article also includes other useful info.

MICRO INTERRUPTS

The BEST of the PET GAZETTE has recently been published and should be of interest to all PET owners. It is available for $9.95 from:

Microcomputer Resource Center, Inc.
1929 Northport Drive, Room 6
Madison, WI 53704

6502 COMPUTER GROUPS

The New England Apple Tree is now meeting on the third Wednesday of each month, 7 - 10:00 PM, at the cafeteria of the MITRE Corp. in Bedford, MA. You can contact, for further information:

Richard F. Suitor
166 Tremont Street
Newton, MA 02158

The Carolina Apple Core has been formed in the Research Triangle Area of North Carolina. The monthly meetings are on the third Tuesday of the month at different locations. Annual dues are $5.00 and include a monthly newsletter. Contact

F. "Butch" Clayton, President
5212 Inglewood Lane
Raleigh, NC 27609
919/682-3756 or 596-8970

New York City now has an Apple users group: The Big Apple Users Group. Meetings are the second Tuesday of every month at the Computer Mart of Manhattan at 6:30 PM. For further info contact:

Neil Shapiro
34 Spencer Drive
Bethpage, NY 11714
516/579-4295 (home)
212/262-4808 (office)

The Apple Corps of San Diego is publishing an eight page newsletter. Unfortunately, by the time it reaches us, the information on the next meeting is too dated for us to print. The person to contact for information is:

Phillip A. Lemon
5485 Repecho Drive, L=108
San Diego, CA 92124
714/560-7962

***** ATTENTION ALL 6502 CLUBS *****

Now that MICRO is published monthly, we can get the word out on when and where you are meeting - if you get the word in to us. We need times and dates and places by the first of the preceeding month - April 1 for the May issue and so forth. Also, please put us on your mailing list for any newsletter or other material you send out. We want to help your club prosper by giving it as much exposure as possible, but we need your input to make it happen.

*** On The Cover ***

With all of the new 6502 based microcomputers, it is easy to forget about the KIM-1 which was the first 6502 system. Many thousands have been sold, and after a period of production problems, the quality of the KIM-1 has been remarkably improved recently. Considering all of the articles we continue to receive about the KIM-1, it looks as though this system is here to stay for a long time.

apple II

PET™

SYSTEMS*

Apple II 16K RAM $1195.00 • **Commodore PET** 8K RAM $795.00 • **Commodore KIM I** $159.00

HARDWARE

APPLE II HARDWARE:

- **Modem for Apple II, ready to go**
  Plug into telephone wall plug $379.00
- **Upper & Lower Case Board**
  Now you can display both upper and lower case characters on your video with the Apple II. Includes assembled circuit board and sample software $49.95
- **Programmer Aide** $50.00

PET HARDWARE

- **Beeper** $24.95
- **Petunia**—for computer generated sounds $29.95
- **Video Buffer**—to put your pet's pictures on a television set or monitor $29.95

PRINTER SPECIALS FOR APPLE AND PET

- **TRENDCOM 100** with interface for Apple or PET $405.00

Introducing

40 characters per second	Bidirectional look ahead printing
Microprocessor controlled	Low cost thermal paper
96 character set	4"x 80 ft. roll $2.50
High Reliability	Clear 5 x 7 characters
Quiet Operation	8 bit parallel input
Sturdy metal/plastic case	No external power supply

40 characters per line

- **Anadex DP-8000** with tracter
  8" paper width and Apple interface $1050
- **Centronics 779-2 for Apple II**
  With parallel interface $1245.00

See if you qualify for a CCI of OC P/F Card and get great discounts on selected purchases for your Apple and PET.

WHY SHOULD YOU BUY FROM US?

Because we can help you solve your problems and answer your questions. We don't claim to know everything, but we try to help our customers to the full extent of our resources.
—Prices subject to change.—

6791 Westminster Ave., Westminster, CA 92683 714-898-8330

Hours: Tues-Fri 11:00 AM to 8:00 PM—Sat 10:00 AM to 6:00 PM (Closed Sun, Mon)

Master Charge, Visa, B of A are accepted. No COD. Allow 2 weeks for personal check to clear.
Add $1.50 for handling and postage. For computer systems please add $10.00 for shipping, handling and insurance. California residents add 6% Sales Tax.

AN APPLE II PROGRAM EDIT AID

Alan G. Hill
12092 Deerhorn Dr.
Cincinnati, OH 45240

When editing an Apple Integer Basic program, you often want to locate all occurrences of a variable name, character string, or BASIC statements. This is usually the case when you are changing a variable name, moving a subroutine, etc., and you want to be sure you have located all references. The BASIC Edit program presented here should aid your editing.

The BASIC program should be loaded into high memory and the program to be edited appended to it. The Edit program uses a machine language routine at hex 300 to 39F to search BASIC statements for the requested string and return the BASIC line number in memory locations 17 and 18. The routine is re-entered at 846 to find the line number of the next occurrence. This process is continued until no further occurrences can be found. The high order byte of the line number (location 18) is set to hex FF to indicate that the search is finished.

BASIC Edit Program

Note in line 32680 of the BASIC program that LIST LINE is an invalid BASIC statement. You will have to resort to a little chicanery to get the statement in. First code line 32680 as PRINT LINE. Then, enter the monitor and change the PRINT token ($62) to a LIST token ($74). This is easiest done if you code line 32680 first and then search for the token in high memory ($3FFA when HIMEN is 16384).

After coding the BASIC program and the machine language routine, you will then need to append the program to be edited. Note that the program must have line numbers less than 32600. To append a program, you must first "hide" the Edit program. This is done by moving the HIMEN pointer (202) and (203) down below the Edit program. Then load the edited program and reset HIMEM: i.e.:

```
LOAD (EDIT PROGRAM)
POKE 76, PEEK (202)
POKE 77, PEEK (203)
LOAD (PROGRAM TO BE EDITED)
POKE 76,0 HIMEM MOD 256
POKE 77,64 HIMEM/256
```

You can then RUN 32600 the Edit program. Enter the character string or variable name to be searched when prompted by "FIND?". To search for a hex string (e.g. all occurrences of COLOR=), enter an @ character followed by the desired hex character pair (@66 for the COLOR= example)

EXAMPLES

To find all occurrences of:	**Input**
SCORE	SCORE
XYZ	XYZ
RETURN	@5B
DIM A	@4EC1
All references to 1000	@E803

The Edit program will end if the screen is full (> 18 lines). To continue the search for more occurrences, a RUN 32720 will return another page. Happy Editing!

Find Routine
Page Zero Memory Map

$3-4	Address of search limit. Set to HIMEM by routine, but could be set lower to avoid searching Edit program.
$6-7	Address of BASIC Token compared. Incremented until it exceeds Limit Address
$8-9	Ending address - 1 of current statement being scanned
$A-B	Address of string being searched. Set up by Edit program
$ C	Length - 1 of string being searched. Set up by Edit program
$11-12	Line number of statement containing the requested string. $12 is set to $FF if no more occurrences

LIFESAVER

by J. Stelly
10918 Dunvegan Wav
Houston, TX 77013

Is LIFE passing you by; does it progress so quickly than there is little time to enjoy it? Well, fear not–the LIFESAVER is here. Though time marches on, now you are in control. If you got "LIFE For Your PET" from Dr. Frank H. Covitz (**The Best of Micro**, p.65), LIFE moves along at a pretty good clip. LIFESAVER is a BASIC program that complements and provides some enhancements to Dr. Covitz machine language routines.

LIFESAVER provides a convenient grid for setting up cellular patterns, permits saving and loading of patterns on the built in cassette unit, and gives complete control of the time interval between generations. You may even single step through the LIFE sequences.

Commodore is supposedly mailing all owners of early model PET units the TIM monitor on cassette, so I will assume its availability in this discussion. It ain't the best monitor in the world, but it does allow you to load machine language programs directly from the cassette without any special loader routines. This does not exclude other methods the reader may have at his (or her) disposal if TIM is not available.

A single modification to Dr. Covitz program is required before it can be used with LIFESAVER. Location 191D (16) should be changed to read:

191D 60 RTS

When this change is made the program may be entered at 190A(16) e.g. SYS(6410). If the TIM monitor is used, simply do a hex dump of the machine language listing and save the program on tape using the instructions given in the manual.

Before loading LIFE (Dr. Covitz program) or LIFESAVER (by yours truly) from cassette, I recommend the following command be executed:

POKE 134,0:POKE 135,24

This lowers the BASIC boundary and prevents conflicts between the two programs. The regular BASIC limit can later be reinstated by POKE 135,32. It is also a good idea to load LIFE before LIFESAVER is loaded. This prevents the data pointer from getting initialized to the wrong location.

It may be possible to eliminate lines 3015 and 3035 from the BASIC listing, if you have a relatively late model PET. These lines are necessary for the older units that have a problem with writing file headers and cassette motor start/stop control. My unit was delivered in Sept. '78 and I was able to eliminate these lines.

Assuming that both LIFE and LIFESAVER have successfully been loaded, you may begin entering your favorite cell patterns. Please refer to Dialog 1 (human inputs are underlined) to see how this is done. After the grid is printed simply press the 'RETURN' key and enter your pattern anywhere in the grid area using the cursor keys and the dot (•) symbol above the Q key. After you've created the desired pattern press the 'HOME' key and the 'RETURN' key in succession. This neat little trick returns control to the LIFESAVER routine without having to explicitly key in the command 'GOTO 1000'. After the PET has saved the pattern internally the user then has the options to save it on tape, have the computer generate LIFE patterns as described in Dr. Covitz article, or scrap it and input a new pattern.

The options are relisted after the execution of any LIFESAVER command. Examples on exercising the different options are given in the remaining dialogs.

LIFESAVER should relieve the user from the tedium of having to manually reenter a LIFE pattern every time it is desired to run it. It should also encourage the user to experiment with various LIFE forms, some of which are quite dazzling.

DIALOG 1

```
RUN

LIFE

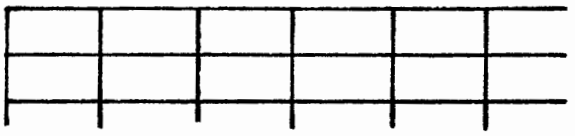
PLEASE CHOOSE AN OPTION

1. CREATE A PATTERN
2. RUN LIFE GENERATOR
3. LOAD A PATTERN FROM CASSETTE
4. SAVE A PATTERN ON CASSETTE

OPTION NUMBER ? 1 (RETURN)

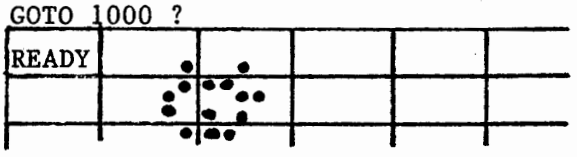
     (SCREEN CLEARS, THEN ...)

GOTO 1000 ?
```



```
(At this point the user hits the
RETURN key and proceeds to input a
cell pattern.)

GOTO 1000 ?
READY
```



```
(With the desired pattern on the CRT
the user presses the HOME and RETURN
keys to resume program execution.)

STORING CELL PATTERN

(After a slight delay the computer
again responds with the option list.)
```

DIALOG 2

```
LIFE
  .
  .
(Option List)
  .
  .
OPTION NUMBER ? 2 (RETURN)

(Screen clears ...)

HOW MANY GENERATIONS ? 7
DEVELOPMENT RATE
0:SINGLE STEP VIA (G) KEY
1-99:INTERMEDIATE RATES
100:MAX (255 GENERATION LIMIT)

RATE ? 75

(The computer proceeds to display
generations sequentially at the
specified rate.  The larger the
numerical value of the rate the
faster the generations are produced.
A rate of 0 meanc that only one
generation is produced at a time.
The G key must be pressed to obtain
subsequent generations.)
```

DIALOG 3

```
LIFE
  .
  .
(Option list)
  .
  .
OPTION NUMBER ? 4

(Screen clears ...)

HOW MANY
PATTERN NAME ? CHESIRECAT (RETURN)

(Pattern is saved and the option
list is printed.)

NOTE:  In the following BASIC listing
the lower case abbreviations stand for
cursor control keys and have the
following meaning:

      clr = clear screen
      home = home up
      cd = cursor down
      s = space key
```

CORRECTED KIM FORMAT LOADER FOR SYM-1

Nicholas J. Vrtis
5863 Pinetree S.E.
Kentwood, MI 49508

My cassette is an old model GE, and it won't quite hack the high speed tape format of the SYM-1, so I have probably used the KIM format option more than most SYM owners. In the process, I have found a bug in the SYM monitor tape load routine. Synertek knows about the problem, but didn't have a nice fix when I called, so I worked up the attached program.

The problem with the monitor routines is that they will not load a slash (hex 2F) from a KIM format tape. The slash is used to indicate that the data is done, and the checksum follows. The monitor routines don't check for the slash until after the KIM characters have been read and combined. The error you get is a checksum error (ER CC).

Most of the code for this program has been copied from the SYM monitor routines, except these work. The basic logic change is that when a slash is read as a single KIM byte, it is treated as a non-hex character. The non-hex routine checks for the slash instead of after every character. If it is a slash, it goes to the checksum check routine.

This routine is not as fancy as the monitor routines, but it sure beats re-keying a couple K bytes of program. It has turned out to be convenient to have this program available even for loading programs without the slash. By changing the branch after the compare for the slash to a branch back to LOADT7 it will ignore errors. Sometimes this will load a bad tape with only minor errors. Other times the program gets out of sync and loads garbage. It is worth the try for a tape you have spent a lot of time on.

One final comment about cassettes. If you have the remote control connected, putting a hex CC into location A00C will turn the cassette motor back on. It is easier than yanking the remote plug.

```
                        FIXED SYM-1 KIM FORMAT LOADER

A CLOSE LOOK AT THE SUPERBOARD II

Bruce Hoyt, Pastor
Sharon Associated Reformed Presbyterian Church
Route 1
Brighton, TN 38011

Late in December 1978 my dreams came true. Those dreams I had had in the mid 60's when I first learned how to program computers. I had dreamed of having my own desk-sized computer. That dream has come true to a degree I would not have thought possible then. The computer I now have is not desk-sized but is contained on one printed circuit board. Furthermore it is more powerful than the big monsters I worked on in the mid 60's.

I don't want to bore you with a description of my continual amazement at a computer on a chip for such things are now old hat. Nor do I want to give just a general overview of the Superboard II manufactured by Ohio Scientific. For a general description you may check the March 1979 issue of **Popular Electronics**, p.76. I want to go somewhat deeper into evaluating and describing the Superboard II (Note: the Challenger IP also manufactured by Ohio Scientific is the same computer in a case with power supply).

HARDWARE

KEYBOARD:

The keyboard is mounted directly on the printed circuit board as can be seen in the advertisements. It is a polled keyboard which is polled by writing to a latch addressed at memory location DF00. This latch feeds the rows of the keyboard matrix. When a key is depressed the latch signal is fed through the key switch to a tri-state buffer and back onto the data buss. A read of address DF00 will pick up the signal from the column in which the key is depressed. This method of polling the keyboard makes the hardware very simple (and cheap) but it is effective. In my view a polled keyboard like the one on the Superboard II is better than a hardware implemented ASCII keyboard. Several nice features can be incorporated this way. For example every key has an automatic repeat feature. You have direct access to every key on the board for gaming purposes. Another keyboard can be put in parallel with the existing one. I plan to add a Hex keypad this way. OSI has provided a jack with several of the keyboard lines on it so that switch type joysticks may be connected for games.

For ordinary ASCII input from the keyboard the monitor includes a subroutine which returns the ASCII value of any key depressed. So for all practical purposes this arrangement works just like any other ASCII keyboard.

OSI has fed the signal from the keyboard through a resistor network and then out the game jack. This signal may be connected to a speaker to make sounds or music. The only reason I cannot give a further description of this feature is that OSI failed to include the resistors and I haven't yet gotten around to it.

VIDEO DISPLAY:

The video display is elegant and simple from a hardware point of view. The display on the screen is 32 by 32 but has no guard bands. My monitor displays about 27 by 30 screen size. The software supplied with the Superboard uses only 24 character lines since many who buy the Superboard may want to connect it to an ordinary TV through a video modulator. The video display is refreshed from a 1K memory located at D000-D3FF. Any byte written into this memory gets fed through a character generator and then sent to the screen. The character generator produces not only the full set of ASCII symbols but also more than 100 graphics symbols. It is complete enough to do just about anything you would want to on a 24 by 24 screen: Life, Tic-Tac-Toe, Pong, Racecar, Ship-tank-airplane warfare, etc.

You may wonder about the access to the refresh memory since both the CPU and the video disply circuitry must use it. The video display memory is accessed through a multiplexer which is normally connected to the refresh circuitry. This multiplexer allows the CPU to access the memory whenever the CPU addresses any memory from D000to D3FF. This causes a slight blink in the display on the TV monitor but the blink is almost unnoticable. Even constantly writing to the display memory causes only a slight decrease in brightness and some flicker of the picture. But whoever writes constantly to the display memory anyway? There is no affect at all on the monitor when the CPU is accessing memory other than the video memory.

CASSETTE I/O:

The Superboard comes with a KC standard cassette interface built in. This operates at 300 baud. That is somewhat slow for loading long programs but the slowness is compensated for by the accuracy. I have yet to find a read error. The hardware for the interface uses a Motorola 6850 ACIA to generate serial data. I think that a small change in the clock used for this ACIA could speed up operation but I have not checked this out yet. This 6850 is located at FOOOFOOI in the memory space.

The greatest difficulty with the cassette interface is that no provision has been made for motor control. It would have been simple to use the Request-to-Send output from the 6850 for this purpose. I plan to connect the Request-to-Send output to a small reed relay for this purpose.

COMPONENTS:

The board itself is high quality epoxy-glass. It is double sided, through the hole plated. The CPU is a 6502A and so has plenty of reserve. The RAM chips and other support are mostly low power variety. All have recent date codes. The character generator and the BASIC ROM's are masked programmed type but the monitor is an EPROM. I suppose you could reprogram the Monitor to suit some particular need you might have. The schematics are accurate and clear. They are very easy to follow since this computer is not really very complicated. The only complaint I would have is that various sections of the schematic are not labelled as to their funtion. But with a little study you can figure them out.

FUTURE EXPANSION:

An empty 40 pin DIP socket is provided for expansion. All the important control, address, and data lines are connected to this DIP socket. OSI makes a model 610 expansion board which connects to this DIP socket. The 610 expansion board comes with a timer, printer interface, and disk interface along with room for more memory. I personally plan to go from this DIP socket to a KIM type connector for interfacing but there are many possibilities for expansion including the S-100 bus or OSI's 48 pin bus.

SOFTWARE

MONITOR:

The monitor comes in an EPROM at the high end of memory and contains the interrupt vectors, the keyboard input routine, cassette I/O routines, and a memory access routine which allows you to view or change any memory location. With this capability it is very easy to load mchine language programs by hand and then execute them or save them and later load them from tape. One deficiency is the lack of a cassette save routine in the monitor.

The monitor has a load routine but no save routine. I have written a save routine which incorporates a Hex memory dump. (See figure 1) This routine saves data in a format acceptable to the monitor load routine. I have located it at 0222 since this space is unused by the BASIC interpreter. The begin address and the end address of the code to be saved must be entered at 00F7 and 00F9 respectively. When you execute the save routine, be sure to turn on your recorder! The code will be saved on tape as well as displayed on the monitor screen. If you want to use this program as a memory dump just run it without turning on your cassette. Several important monitor routines as well as some Basic routines are listed in Table 1.

BASIC:

The BASIC in ROM is an 8K Microsoft product. It is called a 6 digit BASIC since only 6 digits of precision are displayed. Internally, however, all numbers are carried in floating point form with 23 bits of precision (actually the precision is 24 bits since a high order 1 bit is assumed). That amounts to 7½ digits of precision internally. Though this BASIC is very good and very fast it is still a BASIC interpreter and allowance must be made for that fact. I have a puzzle that I have programmed in both BASIC and machine language. The machine language program takes about 1½ hours to run to completion. The BASIC program would take over a month! Superboard is what OSI calls its "immediate mode." That means that any statement can be entered without a line number and it will be executed immediately. Since "?" can be used in place of "PRINT" it is possible to interrogate the computer for any piece of information you might want. For example ? A yields thevalue of the variable A in the memory. ? 45-20 yields 25. ? PEEK (255) yields the contents of memory location 255 in decimal. GOTO 40 sends BASIC to statement number 40 and begins execution at that point. This last feature is very useful in debugging. One could say that the immediate mode allows you to use the Superboard as a super-calculator and provides a built-in debugger. The BASIC alone is worth the price of the computer.

ASSEMBLER:

There is one available from OSI on tape but I haven't tried it out. I want to write my own and put it in an EPROM.

DOCUMENTATION:

A few words must be said about documentation. Frankly, it is not up to OSI's high quality in the hardware and software areas. The graphics manual is by far the best, providing pretty clear descriptions and giving good examples. The users manual leaves something to be desired in clarity. It is too brief and rather vague at points. I have had real trouble trying to use machine language since there is virtually no description of the machine instructions. I also had some trouble figuring out what pins to connect my cassette to since the diagram is not clearly labelled. The BASIC manual is very brief–admittedly so. OSI expects you to have on hand a BASIC reference manual if you are not thoroughly familiar with the workings of BASIC. One serious problem is an error in the BASIC manual relating to the USR function. It tells you to poke the starting address of the USR routine into locations 023E-023F but this does not work. In the graphics manual there is an example of the use of the USR function. In that example the starting address of the USR routine is poked into 000B-000C. This works. I do wish that manufacturers would supply complete documentation with their software including source code. OSI provides almost nothing in the way of description for either the monitor or BASIC. I have disassembled the monitor and figured it out but have not yet started on BASIC. If anyone has inside information on the inner workings of Superboard BASIC please let us know. Think of all those good routines in BASIC that we could use to memory saving advantage: conversion routines, arithmetic routines, text editor, scanner, etc.

Though I have had to give a few negatives about the Superboard II I am well impressed with the quality of both hardware and software. If you are undecided as to what computer is the best buy for the money, I urge you to send your $279 check to OSI and ask for a Superboard. I don't think there is anything as good for the price on the market.

OSI CASSETTE SAVE/HEX MEMORY DUMP

BRUCE HOYT
MARCH 1979

TO USE, PLACE THE START ADDRESS OF CODE TO BE SAVED IN 00F7,00F8 AND THEN THE END ADDRESS IN 00F9,00FA. TURN ON THE TAPE RECORDER AND EXECUTE. NOTE: THIS PROGRAM WILL SAVE ITSELF ON TAPE.

Table 1.

EKIM OR MAXI-KIM
Extended Keyboard Input Monitor

Andrew V.W. Sensicle
155 Valois Bay Ave.
Pointe Claire, Montreal
Quebec, Canada H9R 4B8

Although KIM-1's ROM contains useful features like the tape and TTY input-output routines, when it comes to inputting data or coding via the key pad, KIM's resident monitor leaves much to be desired, for example the avoidance of repetitive pushing of the "↑" between each entry or the ability to look back a few bytes without going into address mode. I would like to thank Jim Butterfield for his excellent BROWSE and BRANCH PROGRAMS which I put together in Page 1 and have used religiously since I got started in this game in mid '78.

However, these have their limitations and I have frequently found the need for a little more sophistication, not to mention the space they occupy in Page 1. Anyway the thing which irritated me most was the need to re-enter a long listing merely in order to open up a few spaces for additional instructions. The process of tidying up a finished program, entailing closing up unwanted spaces and the associated readdressing was also very time consuming.

I thus decided to try to write an extended monitor which would be compact enough to fit in Page 17 and yet provide the functions I needed. After much condensing and compressing I ended up with a program 6 bytes longer than the "legal" Page 17 RAM, but by stealing a little from KIM it fits nicely. KIM doesn't seem to mind. As long as you don't use the tape or TTY routines, he leaves you alone.

The **NMI** vector is loaded with the start address (1780) so that the **ST** key can be used to access the monitor at any open cell address. Before pressing **ST** or after exitting via **RS** the resident monitor is used as a normal in the **AD** mode. The **ST** key gives you 6 other modes of operation or functions.

1. **STAND BY MODE [ST]:** This starts the program which then sits looking at the open cell address and its contents, ie. nothing seems to happen. However, any HEX key is stored at the open cell address which each second key stroke increments the address.

2. **INCREMENT** [↑]: Big deal! This works just like normal.

3. **DECREMENT [PC]:** This steps the address points backwards exactly the reverse of "↑".

4. **OPEN UP MODE [AD]:** Each depression of this key causes one full page of bytes (FF) to be moved one place up starting at the open cell address.

5. **CLOSE UP MODE [DA]:** Each depression of this key causes one full page of bytes to be moved one place back to overwrite the open cell contents. Having made an "open up" or close up move of one or more steps you will, of course, have to fix up all affected addresses. This is not as onerous as it sounds if you use the sixth mode.

6. **BRANCH MODE [GO]:** When a branch instruction is encountered while entering a new program or fixing up an old one, all you need do is press "GO" followed by the actual destinction address (low order only). The monitor will calculate the relative address, store it in the open cell and step on to the next cell all in the twinkling of an eye. The user is, as usual, responsible for ensuring that the branch does not exceed the normal half page range.

I hope that this little program will be as useful to others as it is and has been to me.

A CASSETTE OPERATING SYSTEM FOR THE APPLE II

Robert A. Stein, Jr.
2441 Rolling View Dr.
Dayton, OH 45431

Have you ever wished that as great as the Apple II computer system is that you were able load programs by name from a library cassette? Well, with this mini-sized cassette operating system you can stack many programs on one cassette and load the one you want by typing in its name. Great for showing off your system without juggling a dozen or so cassette tapes.

The **Cassette Operating System [CASSOS]** resides in memory at locations 02C0 to 03FF, where it won't get clobbered by BASIC programs or initalization. Add the optional cassette control circuit, or purchase one of the commercially available ones. (Candex Pacific, 693 Veterans BLVD, Redwood City, CA 94063) and you never need envy the PET for its loading technique again.

Operation

Load the 'CASSOS' tape, which you have created from the assembly listing, just like any other machine language program (2C0.3FFR), then initalize the BASIC pointers by depressing CTRL-B, return. To load a program depress CTRL-Y and RETURN. "PROG?" will be displayed, enter a 1-10 character program name. The cassette tape will be searched and the program loaded if found. "XXXXXXXXXX LOADED" will be output, where XXXXXXXXXX is the program now in memory. If the cassette control circuit (described later) is present the tape will also be stopped. A line of question marks (??????????) are displayed if the requested program was not found. To write a program to the library cassette enter Yc (Ctrl-Y, "WRITE", and RETURN. Program will be saved under the name requested at PROG? . "XXXXXXXXXX OUT" will be displayed at completion and the recorder stopped. To end a cassette program file enter: Yc, "EOF", RETURN; a special record header will be written. Note that to conserve limited memory space the EOF routine utilizes the program write subroutine so the "XXXXXXXXXX OUT" message should be ignored.

The program is structured such that the last 63 locations of the input buffer is used for display messages, so if more than 191 characters are entered at one time the program will still function, but without messages. The listing as presented was for a 16K system, change location 0358 as follows for a different configuration:

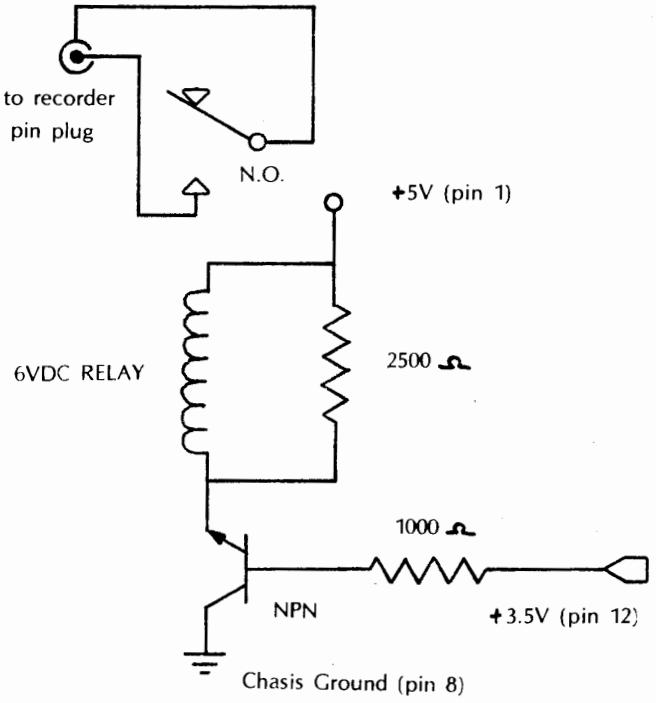
2F-8K	6F-24K
3F-12K	8F-32K
4F-16K	9F-36K
5F-20K	CF-48K

Program Design

The method by which CASSOS functions is to write a program header block consisting of header ID, program name, and start of the BASIC load. This is followed by the program data itself, utilizing the Apple monitor routines.

A Cassette On/Off Circuit

The following diagram describes a simple circuit for stopping and starting a cassette recorder which has a "remote" plug from the Apple II under program control. The theory involves activating or deactivating the AN3 signal on the Apple game connector. A store to location CO5F turns the recorder on and location CO5E turns it off. The strobe triggers a transistor which in turn opens a relay and closes the connection to the remote plug, starting the recorder. If your recorder requires an open connection to start tape movement wire the relay normally closed instead of open. It is also possible to add a relay that would interupt power to the recorder for control if you have no remote capability on your recorder.



Cassette Control Circuit

Parts List

All parts were purchased at a local Radio Shack
- 6VDC Relay (275-004)
- NPN Transistor (2N3568 or equivalent)
- 1000 Ohm Resistor
- 2500 Ohm Resistor
- Mini-Plug

All connections were made to a DIP Header which was modified by soldering a 16-pin IC to it so that the game paddles could still be used without modification when the cassette ON/Off circuit was in use. The common 6VDC relay was modified to be triggered by the game connector signals by wiring a 2500 ohm resistance (utilizing a series of resistors connected in series so that the sum is 2500 Ohms) in parallel with the relay coil. If your recorders rewind controls are disabled by the remote jack wire a switch to bypass the transistor between chasis ground and the relay, which will allow the rewind to operate when depressed. If all this is beyond your scope use the purchased control or simply stop and start the recorder manually.

A Cassette Tape Catalog

Shown in exhibit is a short integer BASIC program which when loaded will list all the programs on a CASSOS format library tape. The CASSOS sub-routines are used so the software must be core resident. Just load the program, insert the library cassette into the cassette handler, and type RUN after starting the cassette player.

```
 10 N=1: CALL -936: VTAB (10): DIM X$(1)
 20 INPUT "INSERT LIBRARY TAPE AND DEPRESS 'RETURN'";X$
 30 POKE -16289,0: CALL -936: GOSUB 300
 40 PRINT "FILE #  PROGRAM NAME  BYTES"
 50 PRINT "------  ------------  -----"
 60 CALL 840: CALL -259
 70 IF PEEK (688)= ASC("E") THEN 210
 80 IF PEEK (688)# ASC("S") THEN 200
100 REM  LOAD INTO NON-EXIST MEMORY (800-BFF)
110 POKE 60, PEEK (700): POKE 61,( PEEK (701)+128)
120 POKE 62,255: POKE 63,191: CALL -259
130 PRINT N,: POKE 789,2: POKE 788,177: CALL 785
140 L= PEEK (700)+ PEEK (701)*256
150 L=16384-L:N=N+1
160 PRINT "     ";L: GOTO 60
200 GOSUB 300: PRINT "NO EOF MARK"
210 POKE -16290,0: GOSUB 300
230 PRINT "***END OF FILE***"
240 CALL -155
300 FOR I=1 TO 30

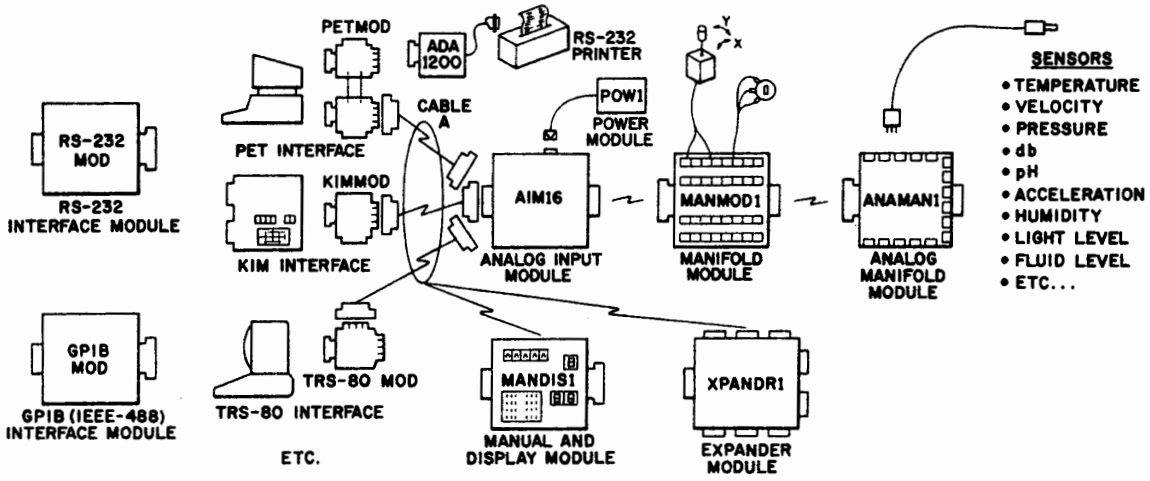
DAM SYSTEMS



DAM SYSTEMS by CmC
A complete system of modules to let your computer listen to the real world.

DAM SYSTEMS PRICE LIST

DAM SYSTEMS components

AIM161 - Analog Input Module — $179.00
16 8-bit analog inputs - 100 microsecond conversion time - 3 state output - requires one 8-bit computer output port for control and one 8-bit computer input port for data.

AIM162 - Analog Input Module — $249.00
As above plus: greater accuracy - gold plated contacts - pilot light - switch selectable start, enable and reads polarities.

POW1 - Power Module — $14.95
Supplies power for one AIM16 module.

ICON - Input Connector — $9.95
For connecting analog inputs to the AIM16 - 20 pin card edge connector - solder eyelets.

OCON - Output Connector — $9.95
For connecting the AIM16 to a computer - 20 pin card edge connector - solder eyelets.

MANMOD1 - Manifold Module — $59.95
Use in place of ICON. Screw terminal barrier strips for connecting joysticks, potentiometers, voltage sources, etc. Eliminates the need for soldering. Plugs into the AIM16.

ANAMAN1 - Analog Manifold Module — TBA
Use in place of ICON. Connects DAM SYSTEMS SENSORS to the AIM16 without soldering - sensor cables just plug in. Plugs into the AIM16 or the MANMOD1.

SENSORS — TBA
Sensors for temperature, pressure, flow, humidity, level, pH, motion, etc.

COMPUTER INTERFACES — TBA
For the PET, KIM, TRS-80, etc. Use in place of OCON. Eliminates the need for soldering or special construction.

PETMOD - PET Interface Module — $49.95
Gives two IEEE ports, one user port and one DAM SYSTEMS interface port. Saves wear and tear on the PET's printed circuit board. Also called the PETSAVR.

KIMMOD - KIM Interface Module — $39.95
Gives one application connector port and one DAM SYSTEMS interface port.

CABLE "A" - Interconnect Cables — TBA
Connects computer interface to AIM16, MANDIS1, XPANDR1, etc.

CABLE A24 - Interconnect Cable — $19.95
24 inch cable with interface connector on one end and an OCON equivalent on the other.

MANDIS1 - Manual and Display Module — TBA
Connects between the AIM16 and the computer interface. Allows manual or computer control of the AIM16. Displays channel number and data.

GPIB MOD - GPIB (IEEE-488) Interface — TBA
Allows the DAM SYSTEMS MODULES to be used with the GPIB bus instead of a computer's other I/O ports.

RS232 MOD - RS232 Interface Module — TBA
Allows the DAM SYSTEMS MODULES to be used with an RS-232 port or terminal.

XPANDR1 - Expander Module — TBA
Allows up to 128 8-bit analog inputs (8 AIM16 Modules) to be connected to one system.

DAM SYSTEMS sets

AIM161 Starter Set — $189.00
Includes one AIM161, one POW1, one ICON and one OCON.

AIM162 Starter Set — $259.00
Includes one AIM162, one POW1, one ICON and one OCON.

PETSET1a — $295.00
Includes one PETMOD, one CABLE A24, one AIM161, one POW1 and one MANMOD1.

KIMSET1a — $285.00
Includes one KIMMOD, one CABLE A24, one AIM161, one POW1 and one MANMOD1.

ASK THE DOCTOR - PART III
BITS AND BYTES

Robert M. Tripp, Ph.D.
The COMPUTERIST, Inc.
P.O. Box 3
So. Chelmsford, MA 01824

The Doctor was busy this month and did not get a chance to write up the EPROM Programmer hardware as promised in the last issue. Look for it next time. A couple of people did submit some good info which is printed below. The Doctor encourages such input. Too much is happening with these new computers for anyone person to "know it all", so if you find out something interestng, please drop us a note and let us get the word out.

Corrected AIM SYNC Program

The early AIM User Manuals had a number of mistakes, as is to be expected the first batch. One of the more serious errors was in the listing for the SYN Write and SYN Read programs on page 9-11. The errors have been corrected in later versions of the manual, but for those of you who need the programs, here they are - corrected.

SYN Write Program:

```
0300  20 1D F2   JSR  F21D
0303  20 4A F2   JSR  F24A
0306  4C 03 03   JMP  0303
```

SYN Read Program:

```
0310  A2 00      LDX  #00
0312  A9 CE      LDA  #CE
0314  20 7B EF   JSR  EF7B
0317  20 EA ED   JSR  EDEA
031A  A2 00      LDX  #00
031C  A9 D9      LDA  #D9
031E  20 7B EF   JSR  EF7B
0321  20 29 EE   JSR  EE29
0324  C9 16      CMP  #16
0326  F0 F9      BEQ  0321
0328  D0 E6      BNE  0310
```

Patch for the AIM-DISASSEMBLER

It soon becomes obvious, that the disassembler is extremely paper consuming, because no single-stepping is provided. The following program will save you money and time!

Set F1 (010C) to 'JMP 03D9' and F2 (010F) to 'JMP 03CB'. After loading the desired program address (*), hitting **F1** will dissable just this line on the display. To advance, press the space-bar. If you want to modify, use 'I' and the program jumps to the **Instruction Mnemonic Entry.** The current address will not be changed. **'ESC'** brings you back to the AIM—Monitor. With **'F1'**, the next address will be disassembled. **'F2'**, however, will substract the last used op-code length from the current address and then disassemble the last entry! It is even possible to disassemble further "backwards", just keep switching from **'ESC'** to **'F2'**. Of course, a change in the op-code length will bring up some unexpected results, but very soon you'll catch a proper op-code again!

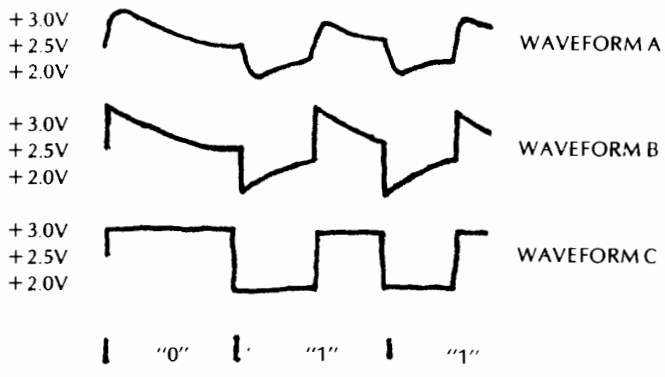
SYM Tape Evaluation

As a result of our telephone conversation on Monday, I decided to look for any possible hardware problems in the SYM Cassette Interface. Some results are shown below. Whether these are related to your cassette problems is unknown. In checking my Sony TC-62, I found an unexpected very slow acting AVC (increases gain very slowly, decreases rapidly). This could cause problems in a level sensitive system as the gain slowly increases during the recording process to a quite large degree.



740 usec
wide

All waveforms taken at PIN 3 of the LM311 (U26) with a sync tape generation program running (hi-speed). Audio OUt (HI) is connected directly to Audio In (A-P to A-L).

WAVEFORM A is the normal condition as received (VIM 80650912 E/C0003)
WAVEFORM B is with C14 (.0047uF) removed
WAVEFORM C is with C14 removed and C16(.01uF) paralled with 1uF

CONCLUSION: C16 is much too small and could easily cause the system to become marginal in the presence of noise and normal level variations. C14 has no apparent real value and seems to unnecessarily increase transition time uncertainty. The small value of C16 and the presence of C14 together simulate the waveform degradation of a very limited bandwidth recorder. Their effect augment rather than compensate for the deficiencies of a recorder. Suprisingly, it appears that it would be a recorder with poor low, rather than high, frequency response which would be most likely to have problems with C16 is maintained at its original .01 microfarad value.

F L A S H ! ! !

Synertek has finally solved the sensitivity problem which has been of concern to users of the tape cassette, according to a spokesman from Synertek Systems. I have sent them a pair of 2716 EPROMs to be programmed with the new monitor. If these are returned in time, I will make a full report in next month's issue.

Comments on Synertek BASIC (8K) V1.1

1) 2 ROM's, U21, U22, C000-DFFF, (J) (0) (CR to start BASIC
2) **Commands** - CLEAR, LIST, NULL, RUNN, NEW CONT, LOAD "A", SAVE "A"
3) **Statements** - DATA, DEF, DIM, END FOR, GOTO, GOSUM, IF.. GOTO, IF...THEN, INPUT, LET, NEXT, ON.. GOSUM, POKE, PEEK, PRINT, READ, REM, RESTORE, RETURN, STOP, WAIT.
4) **Functions** - ABS(X), INT(X), RND(X), SGN(X), SQR(X), TAB(I), USR(I), USR(I,J,...Z), EXP(X), FRE(X), LOG(X), POS(I), SPC(I)
SIN(X), COS(X), TAN(X), ATN(X) all must be loaded separately - App Note 53-SSC not quite available.
5) **Strings** - DIM A$, LET A$, INPUT X$, READ X$, PRINT X$
6) **String Functions** - ASC(X$), CHR$(I), FRE(X$), LEFT$(X$,I) LEN(X$), MID$(X$,I), MID$(X$,I,J), RIGHT$ (X$,I), STR$(X), VAL(X$)
7) **Operators** =,-,+, exponentiation, *,=, (not equal), , , (LTE), (GTE), NOT, AND, OR
8) **Uses Memory** from 0200 HEX up until ROM or no memory, unless restricted at start up.
9) **Weaknesses** - Only editing is delete line, delete last character (RUB-OUT), no ROM TRIG, no program merging capability.
10) **Strengths** - Good array features (but no MAT functions), 9 digit accuracy floating points
4 byte floating point numbers
7 bits + 1 bit sign exponent
1 bit sign + 24 bit binary value (M$bit = 1 always)
& "000F" = 15 decimal
hex string conversion to decimal
USR (I,J,...Z) Machine language subroutine multiple parameters on stack result (A,Y)

Speed is comparable to OSI Kilobaud Oct '77 ratings (1MHz) Overall subjective by infrequent BASIC user: 7.5/10 seems appropriate to overall product.

DR. DALEY'S SOFTWARE FOR THE PET

DR. DALEY's software continues to expand offerings. Listed below are our most popular programs. No PET owner should be without these. Dealers, you should stock them as well.

PET TREK 3 — Like STARTREK, but has several UNIQUE features. For example, the unpredictable EXPERIMENTAL RAY, who knows what it will do ..... **$ 7.95**

BACKGAMMON — It's you vs the PET with an exciting game of BACKGAMMON ..... **$ 7.95**

MASTER MIND — Plays two simultaneous games, one where you guess PET's secret code, and another where PET guesses yours **$ 7.95**

RENUMBER — Will renumber your BASIC programs, including all jump statements. For a 6K source code requires less than 5 seconds **$12.95**

PILOT — A BASIC coded PILOT interpreter. A second high level language for the PET. Simple to use, even a ten year old can learn to use PILOT quickly. With sample PILOT programs and documentation **$12.95**

CHECKBOOK — Will balance your checkbook and save totals in 16 categories on tape. Will produce end of month and year to date summaries. Categories can easily be changed to suit your own purposes..... **$12.95**

MAIL LIST — Keeps a mailing list and will sort the list into sub groups using up to three search parameters **$12.95**

All of our programs are available on tape or for the Compu-Think disk. We charge $5.00 for the disk and shipping, but you can subtract $1.00 for each program which we place on the disk. Order 5 programs and you get the disk free!

MAIL LIST — The above program has been modified for disk files. Will be placed on a disk by itself which you can then use for your mailing list **$19.95**

FLASH! — We have just acquired the rights to distribute a linking loader for BASIC programs! This will allow you to link exclusively numbered BASIC subroutines in memory. No serious programmer should be without this useful programming tool..... **$12.95**

An ideal companion to the linking loader will be our library of useful subroutines which can be linked into your own program. Currently over 25 useful routines are included. These range from plotting utilities to a beautiful display of rolling dice. Write or call for a list or order the set for only..... **$49.95**

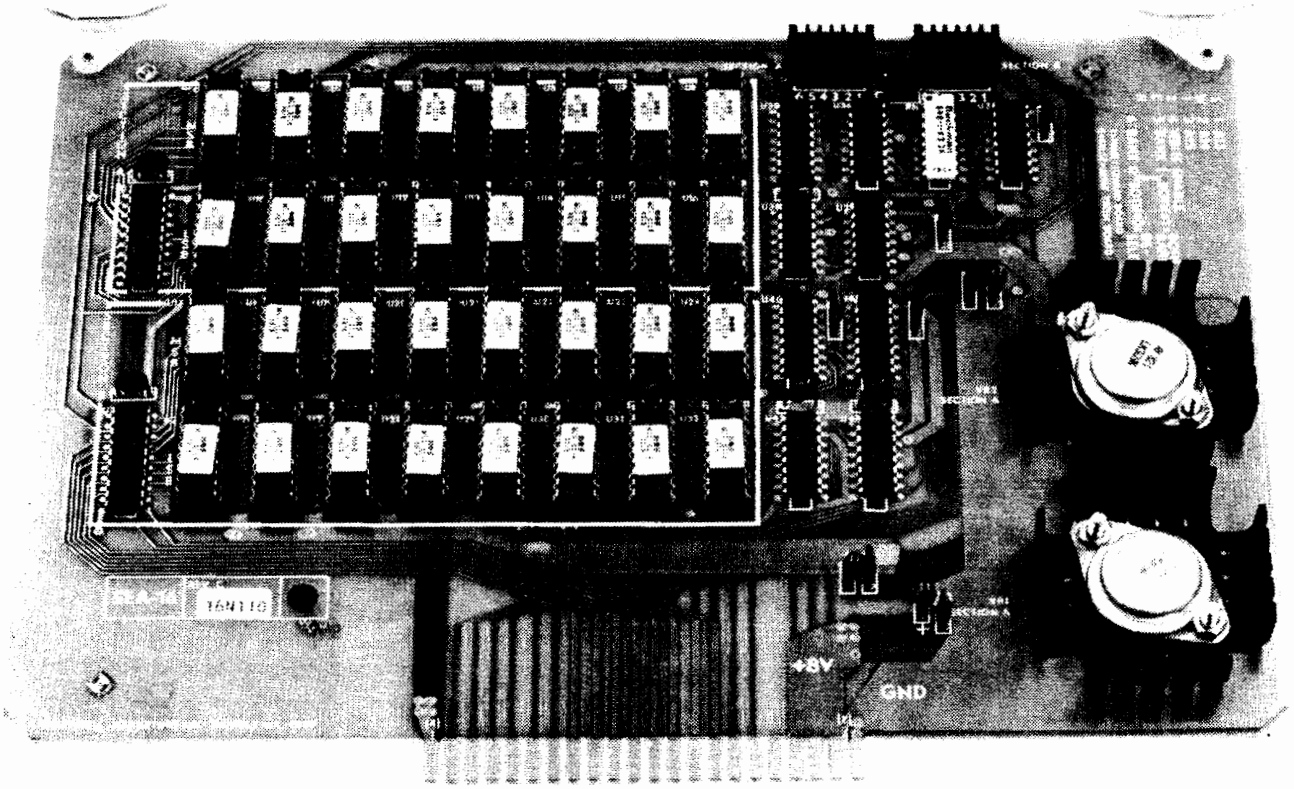
* * *

Remember that we GUARANTEE that your order will be shipped within four business days from receipt or you will receive a coupon for a discount on a future purchase.

Charge your order to MC/VISA

DR. DALEY, 425 Grove Avenue, Berrien Springs, Michigan 49103

Phone (616) 471-5514 Sun. to Thurs. noon to 9 p.m. eastern time



The best memory board around.

Here's why

- Low power 2114 Static RAM's
- Fully buffered
- High quality IC sockets
- All switches accessible from top of board
- Top grade glass fiber PCB, with gold plated contact area.
- Dual regulators
- Two independent 8Kx8 memory banks
- One supply only, 7-9V unregulated

16K Static RAM $325.00 Assembled only.

Designed specifically for the: KIM-1, SYM-1, AIM-65.

Specifications: Access time 450 nS max.
Power consumption 1.35 amp. typ.

Also available: Buffered Mother Board, EPROM Programmer, CVT Power Supply. Software: Standard Forth Compiler, Sea-65 Editor/Assembler.

Order from local dealer or directly from:
SEAWELL MARKETING INC., 315 N.W. 85th, Seattle, WA 98117 • (206) 782-9480
Available in Europe. Write for dealer list.

THE MICRO SOFTWARE CATALOG: VII

Mike Rowe
P.O. Box 3
S. Chelmsford, MA 01824

Name: Slow-Scan Television Package
System: Apple II
Memory: 16K (min)
Language: Machine Language
Hardware: Standard Apple II
Description: This software system allows the Apple II to send and receive U.S. amateur standard slow-scan T.V. pictures (120 line-15 Hz) via any ham radio SSB transceiver. A real-time display of the received picture in high-resolution graphics is accomplished with a sophisticated image processing algorithm. Low-resolution images for transmission are prepared with a large-character display editor as well as a drawing editor. All modulation and demodulation of the audio FM subcarrier is performed by the software — replacing hundreds of dollars of hardware required by other SSTV systems. Comes on cassette with 8 mins. of test pictures.
Copies sold: about 100
Price: $20.
Includes: Cassette tape and 5 pages of documentation.
Author: Chris H. Galfo — WB4JMD
Available from:
C.H. Galfo
602 Orange St
Charlottesville, VA 22901

Name: S-C Assembler II (disk version)
System: Apple II with at least one disk
Memory: 24K or more
Hardware: Apple II, Disk II, optional printer
Description: Disk version of the popular S-C Assembler for the Apple II. Combines a text editor and an assembler in one memory resident package of 3072 bytes (1000-1BFF). Carefully integrated with the Apple II ROM-resident routines, and with Apple DOS. Editor includes full screen-editing, BASIC-like line number editing, tab stops, and renumbering. LOAD and SAVE commands for storage of source programs on disk files or cassette. JOIN command for appending two source programs from cassette. Standard Apple II syntax for opcodes and address modes. Labels (up to 6 characters), arithmetic expressions, comments in a liberated line format. English language error messages (not coded numbers). DOS and Apple Monitor commands directly available within the assembler. Speed and suspension control over listing and assembly. Includes printer deiver for Practical Automation printer, with instructions for modification to any other printer. (Cassette version is still available: it has fixed line format and labels up to four characters.)
Copies: Over 200 of cassette version, over 25 of disk version.
Price: $35 for disk version, $25 for cassette version (Texas residents add 5% sales tax)
Includes: 32-page reference manual, disk with assembler, Master. Create, RAWDOS, and two sample source programs.

S-C SOFTWARE
P.O. Box 5537
Richardson, TX 75080

Name: PRO-CAL-I
System: Commodore PET
Memory: 8K
Language: Microsoft BASIC
Hardware: PET
Description: PRO-CAL-I is a reverse polish programmable scientific calculator program ideally suited to scientific and educational applications. It combines the best features of the PET with those of hand-held calculators such as the HP 97 and the TI "Programmer". It supports single key execution of more than 50 functions and implements calculations in binary, octal, decimal, and hexidecimal number systems. The program displays 10 memory registers, 5 stack registers, and a record of the 14 most current operations.
Copes: 40
Price: $26.00 for software on cassette and an operating manual.
Author: Robert M. Munoz
Available from:
APPLICATIONS RESEARCH CO.
13460 Robleda Rd.
Los Altos Hills, CA 94022

Name: FINANCIAL ANALYSIS: A Tutorial
System: APPLE II and PET
Memory: 16K
Language: Basic
Hardware: APPLE II with cassette recorder, or a PET (8K)
Description: An interactive learning cassette with chapters on Risk, Short-term and Intermediate-term Financing, Financial Statements, and Key Business Ratios. The user is then put into the position of having to use these concepts by playing the Meany Manufacturing Business Game.
Copies: Hundreds available
Price: Sugg. Retail: $16.50
Includes: Tape cassette and informative booklet
Author: Brian Beninger
Available from:
Local APPLE or PET dealers of:
SPEAKEASY SOFTWARE LTD.
P.O. Box 1220
Kemptville, Ont., KOG 1J0

Name: STAT III
System: Commodore PET
Memory: 8K
Language: BASIC
Hardware: Standard PET
Description: STAT III accepts a set of numbers and calculates the following: mean, median, mode, highest number in the data, lowest number in the data, range, variance, standard deviation, average deviation, and sample standard deviation. STAT III can display a bar graph of the users data on the CRT. In addition the user may correct errors in his inputted data before processing.
Copies: Just released
Price: $7.95
Includes: Cassette, source listing (program is self documenting)
Author: Michael J. McCann
Available from:
THE PET PAPER
P.O. Box 43
Audubon, PA 19407

Name: Apple Pi 'Life'
System: Apple II
Memory: 4K
Language: BASIC and assembly
Hardware: Apple II with 2 operable game paddles with switches.
Description: Apple Pi 'Life' allows variable grid sizes from 8X8 up to 40X40 in increments of 1. Paddle 1 is only read when the switch is depressed. Speed is controlled by paddle 0 and can be varied from 550 gpm to 2000 gpm for an 8X8 grid. For a 40X40 grid, speed can be varied from 25 gpm to 140 gpm. The speaker is toggled each time a cell is processed, except at minimum or maximum speed, to give the sounds of 'Life'. The bottom of the grid wraps around to top of grid, and vice-versa. The right of the grid wraps around to left of grid, and vice-versa. There are three tables of pre-defined objects which can be setup on the grid by number and x,y location. A description of the object table structure is given in the documentation. Keyboard controls are: P-pause until next 'P', Z-zero grid and setup objects, O-setup objects on grid, N-new colors, and E-exit program. Any two distinct colors may be used for live and dead cells.
Copies: New, just released.
Price: $12.00. Texas residents add sales tax.
Includes: Programs, object tables on cassette, documentation.
Order Info: Checks only.

Name: Amateur Radio Communications Package
System: Apple II
Memory: 8K (min)
Language: Machine Language and Integer BASIC
Hardware: Apple II and user provided interface
Description: This software package allows the Apple II to communicate in any of three codes: Morse, Baudot, or ASCII, with a minimum amount of external hardware required. Some features include: Variable size text buffer and live keyboard allow preparing text for transmission while receiving or transmitting; 3 field screen display — each field scrolling separately; user defined stored messages are referenced by a keyboard and can be inserted anywhere in the text; automatic 72 character line formatting with word wrap-around; continuously variable code speeds; adaptive Morse receive and lots more! All I/O uses the on-board (game) I/O connector.
Copies sold: over 100
Price: $18.
Includes: Cassette tape and documentation with sample interface.

SYM-1 6522-BASED TIMER

John Gieryic
2041 138 Avenue, NW
Andover, MN 55303

Your SYM-1 comes with a number of timers capable of a wide range of timing intervals. Unfortunately the SYM REFERENCE MANUAL does not provide information which can easily be digested by a novice. I'd like to attempt a more down to earth description of timer 1 on the **Versatile Interface Adapter 6522** for those of us who aren't hardware inclinded. This timer is capable of very accurate time delays in the range of fractions of a second. It has an interrupt associated with it plus the ability to generate evenly spaced interrupts.

Setting Up The Interrupts

The first step in programming this timer is to place an address in the **Interrupt Request Vector [IRQ]** located at address A67E and A67F. A67E contains the low byte of the address and A67F contains the high byte. This address in the **IRQ** is the location you will be "jerked to" when the timer times down and generates an interrupt. Your code will be as follows:

Location	Code		
200	20 86 8B	JSR ACCESS	disable memory write protect
203	A9 00	LDA #00	interrupt address
205	8D 7E A6	STA A67E	Low byte
208	A9 03	LDA #03	
20A	8D 7F A6	STA A67F	High byte

Our next step is to set two locations so the hardware can "see" the interrupt and tell us where it is coming from. These two locations are the **Interrupt Flag Register [IFR]** at location A00D and the **Interrupt Enable Register [IER]** at location A00E. The **IER** controls interrupts from 7 different sources on the **6522**. We will only be interested in bit 6. This is the one for our timer T1. We must set this bit to a logic 1. This tells the **6522** we will accept interupts from timer T1. The code follows:

Location	Code	
20D	A9 CO	LDA #CO
20F	8D OE AO	STA AOOE

"Hey, wait a minute! Where did that 'C' come from? I thought you said we were only going to set bit 6?"

Yes, I did. We must supply the **6522** with a bit more information (no pun intended). We must tell it we are going to **SET** one of the **IER** bits. This is done by setting bit 7 to a logic 1, hence our CO. Note bits 0 thru 5 are a zero. This tells the **6522** we don't want to change the condition of any of the other bits in the **IER** when we do our store. From this you should be able to see how we **CLEAR** any one of the **IER** bits. You guessed it. Bit 7 will be a logic zero and the **IER** bit(s) to be cleared will be a logic 1.

The **Interrupt Flag Register [IFR]** tells the user which interrupt has occurred (when we get one). This information can be used by the interrupt routine to "see" which element on the **6522** gave us the interrupt. We want to initialize (clear) our flag bit for timer T1 (bit 6). I don't want to disturb any of the other bits. Note clearing a bit in the **IFR** is **not** the same as in the **IER**.

Location	Code	
212	AD OD AO	LDA AOOD
215	29 BF	AND #BF
217	8D OD AO	STA AOOD

When we do get an interrupt from any of the enabled **6522** devices (bit = 1 in the **IER**) then bit 7 in the **IFR** and the corresponding bit in the **IFR** will both be set to a logic 1. We can determine if this interrupt came from the **6522** by just looking at bit 7 of the **IFR** (ASL followed by a test of the C bit). If bit 7 is a logic zero then the interrupt came from some other place. This will save some time when we are trying to find out where this interrupt originated. You should log this bit 7 information in the back of your mind since I won't use it here.

Setting Up The Timer

One more step before starting our timer. I'm going to set our timer to the free running mode. This means it will count down, give an interrupt and then immediately begin counting down again. I won't need to worry about instruction cycle times within any timing loops. I know I will get repeated interrupts at the exact interval requested. Setting the **Auxiliary Control Register [ACR]** bit 7 to a logic 1 establishes the free running mode.

Location	Code	
21A	A9 CO	LDA #CO
21C	8D OB AO	STA AOOB

Now we have the four mechanical steps finished...setting up the **IRQ, IFR, IER** and **ACR**. Setting the time delay is next. The T1 timer has two latches (high and low order) and two counters (high and low order). This results in a 16 bit counter. The low order latch is loaded first. In this example I will set up for a delay of .05 seconds. This corresponds to a count of C350 (one count for each microsecond).

Location	Code		
21F	A9 50	LDA #50	load low order latch
221	8D 06 AO	STA A006	

Now we will load the high order latch with the value C3. This instruction will do more than load the high order latch. It will also write the high order latch into the high order counter as well as write the low order latch into the low order counter. This one instruction will transfer all 16 bits from the latches to the counter at the same instant. Without this hardware assist we would be unable to load the counter accurately since the counter begins to count down immediately after being loaded.

Location	Code		
224	A9 C3	LDA #C3	load high order latch
226	8D 05 AO	STA A005	

The timer is now running and will generate an interrupt .05 seconds (C350) later. This corresponds to 50,000 clock cycles. If you were programming a clock your remaining code at location 229 would now initialize your hours, minutes and seconds counters, initialize the display buffer and then go into a tight loop calling SCAND in order to illuminate the LED's.

Servicing The Interrupt

Our interrupt routine at location 300 is now executed when we receive the interrupt. The first thing we must do is SAVE the processor status and registers. This is done so we can restore these items when we are finished with our interrupt processing and jump back into SCAND from where we were "jerked out."

Location	Code		
300	08	PHP	save processor status on stack
301	48	PHA	save accumulator on stack
302	8A	TXA	transfer X to A
303	48	PHA	save X register on stack
304	98	TYA	transfer Y to A
305	48	PHA	save Y register on stack

If you were programming a clock you would now increment a counter. If the counter equalled twenty then reset it and increment the time in the display buffer by one second.

Now the interrupt is "serviced." In order to clear the way for the next interrupt, the T1 interrupt flag must be reset otherwise the next interrupt will be blocked. This clearing can be done in either of two ways. Method 1 will write into the high order latch. This write uses a different address for the store instruction than the write used to initialize the timer counter. In doing this the T1 interrupt flag will be reset but it will not disturb the current value in the counter. Remember this is a free running counter in our example and automatically resets itself when the interrupt occurred. By this point in time it has already counted down from its original value of C350 toward zero (and the next interrupt). Method 2 will read the low order counter. Either method will reset the T1 interrupt flag.

Method 1

Code

A9 C3	LDA #C3
8D 07 AO	STA A007

Method 2

Code

AD 04 AO	LDA A004

Now the processor status and registers can be restored and a return executed to the location in SCAND at which the interrupt occurred. Remember you **must** restore the registers in the exact reverse order used at the entrance to the interrupt routine. This is a major point.

Code

68	PLA	pull accumulator from stack
A8	TAY	transfer to Y index
68	PLA	pull accumulator from stack
AA	TAX	transfer to X index
68	PLA	pull accumulator from stack
28	PLP	pull processor status from stack
40	RTI	Return from Interrupt

That's the end of the lesson for today. In a future article I will use the information presented here to develop an operating system for your SYM-1.

THE TVT-6: A USER'S REPORT

Edward Chalfin
447 Hendrix Street
Philadelphia, PA 19116

As a computer hobbyist who wanted a video interface for his KIM-1, it took me a long time to decide which video board of the many available to choose. The main factor which influenced my decision was the prohibitive cost of most video interfaces, typically around $150 to $200. Being on a college student's budget, these prices were way out of my range. I was beginning to lose all hope when, at the PCC '77 in Atlantic City, I discovered the TVT-6, a video board for the KIM-1, for only $35!

After mulling it over for a few days ($35 is still a lot of money!) and weighing the board's strengths and weaknesses, I decided to order a TVT-6 kit from PAIA Electronics. I received my kit in about 2 weeks and built it in one night. The construction was fairly easy, although it may have been slightly more difficult for someone with no construction experience. This was due mainly to the fact that the instructions consisted of a reprinted construction article from a magazine. The board worked the first time I hooked it up except for a capacitor which I found out later, after a call to PAIA, had to be a slightly lower value. The effect of the bad capacitor was to widen the characters on the screen to the point that they interfered with each other. I must mention that the Technical Services Dept. at PAIA was very helpful and sent the correct value capacitor to me within a few days.

I must say that Don Lancaster's TVT-6 design is truly amazing but, due to the fact that it uses the 6502 for its timing, it has a few drawbacks. In the remainder of this article I will try to describe the TVT-6's strengths as well as its weaknesses as I see them, having used this video board for over a year.

The main weakness one encounters using the TVT-6 is the fact that the display disappears whenever the display program is not running. When using an interrupt, such as an ASCII keyboard, the problem is not as apparent as when implementing another routine which is relatively long in execution time. Also, if the display program is repeatedly called as a subroutine from another program, a noticeable jitter in the display results, which can be very annoying. A good example of this would be trying to play a 'pong' type game on the screen.

Another minor annoyance is that the display program must be loaded from tape every time the computer is powered up before the display will work. Also, for KIM owners without expansion memory, pages 2 and 3 of the KIM RAM cannot be used for program space without garbage showing on the screen.

One drawback is the fact that memory locations $8000 through $DFFF are used by the TVT-6 scan PROM and cannot be used for expansion memory.

Most of the above weaknesses may seem pretty important at first, but in fact they are not, and there are ways of getting around them. Since the screen flickers when called repeatedly by another program, such as a disassembler listing, I simply have the disassembler fill the screen before calling the display routine, thus displaying whole pages at a time.

Though locations $8000 through $DFFF cannot be used for expansion memory, this still leaves space for 36K of expansion, which I feel is more than enough for the average KIM owner.

Now that I have outlined the weaknesses of the TVT-6 and some ways of getting around them, I will describe its strengths, which, I feel, far outweigh the disadvantages.

The most outstanding advantage of the TVT-6 is its $35 price tag. As far as I know, no other video board even comes close to that price range. Add to that its lower power consumption, (I have used the KIM +5 volt supply to power the KIM and the TVT-6), its small size, variable display size, and software cursor control, and you have what I believe is one of the biggest hardware buys around. Above all, I think that the TVT-6 display is one of the cleanest and sharpest that I have seen!

In conclusion, I must admit that if you can afford to lay out $200 for a video interface, then one of the more expensive boards may be what you need. However, if you're looking for a video board that works great and won't empty your wallet, the TVT-6 is definitely for you!

Editor's Note: One important disadvantage which is not mentioned above is that of using the TVT-6 with existing software. If you are planning to write all of your own code, this is no problem. But if, more typically, you are going to use software which was written by others without a TVT-6, you may encounter serious problems. Some packages may be very difficult to interface to the TVT-6; others may be impossible due to timing considerations. The TVT-6 is a remarkable illustration of what can be done with a 6502 and may be a total solution for some applications. But, it may not be adequate in other applications. For a lot more information on the TVT-6, you should consult (buy?) **The Cheap Video Cookbook** by Don Lancaster, 1978. This book is published by Howard W. Sams & Co., Inc., 4300 West 62nd St., Indianapolis, IN 46288 and retails at your local computer shop for $5.95. This is a good tutorial on videos whether or not you intend to buy/build the TVT-6, but is not for the complete novice.

Birman, Paul "Petting". How to find the end of a program on tape when you want to load a new program into your PET.

437. Personal Computing 3 No 2 pg 63-74 (Feb., 1979)

Gerue and McNeil, "Chess Challenger-10 Wins Microchess Tourney". Microchess 2.0, Peter Jennings entry, took fourth place. This is 6502 based.

437. Creative Computing 5 No 1 (Jan., 1979)

Yob, Gregory "Personal Electronic Transactions". New products described are Expandapet memory, PET ROM disassemblies, a useful book on what the PET rom is all about, Some data on the User Port, PET Video Slave display, Exploring PET random numbers, PET sounds and music, etc.

Wells, Ralph "HOw about a 'Counterfeit Cursor' For your PET?". Enables one to use the cursor in games or under better control.

Heuer, Randy "Ohio Scientific Superboard II and Challenger 1P". A review of OSI's new lost cost micro.

Rugg and Feldman "Speed Reading Made Easy...via Your PET". This program turns your computer into a tachnistoscope to teach improved reading habits.

Milewski,Richard A. "Apple-Cart". All about Data Files on diskettes. Simple file accessing statements, Sample serial access programs, and some software reviews.

THE ULTIMATE PET RENUMBER

Don Rindsberg
The Bit Stop
Box 973
Mobile, Alabama 36601

This article can be of help to the BASIC programmer in providing a fast, fool-proof renumbering system, but it also includes details on how to use the PET BASIC interpreter's own machine-language routines to do some useful chores.

Renumbering programs written in BASIC, such as Jim Butterfield's (see MICRO Dec 78 - Jan 79) are very slow in renumbering long programs, and because BASIC is cumbersome in performing such routine chores, the machine-language approach has some major advantages. This routine will renumber a 300-line program in around 20 seconds, as compared to more than 300 seconds for Jim's BASIC version. Further, Jim is forced to duck the issue of providing space for extra-digit line numbers, whereas by calling BASIC's line insertion routine, this program provides enough space for five digits for every GOTO, GOSUB, etc.

The entire program for renumbering is given in hexadecimal in listing 1. More later about how to enter it into your machine. With your BASIC program and the renumber routine in RAM, press SYS8181 (by coincidence, the name of the program) and you will either get a message of reassurance that all has gone well, or will get an error message, such as "line too long". In no case will the program bomb, because this is a two-pass program; during the first pass, nothing is done to the Basic text, other than making sure there is enough space for five-digit line numbers. If any problem exists, the BASIC text is unchanged.

DEVELOPING THE PROGRAM

Commodore made it a formidable task to decipher the code of BASIC sufficiently to be able to make patches for a short renumber system. The first obstacle is that the PEEK statement is disabled for the area of memory where BASIC resides. But, by sleight-of-hand, a little PUNCHing and POKEing and addition of a simple output port on PET's memory-expansion connector, the PET disgorged the contents of its ROMs into my homebrew machine and onto a disk; now, with the capability of having the programs in RAM, where breaks could be inserted for diagnosis, the job became a little easier.

Programming a renumber routine is made tedious by the fact that, in the BASIC text, the line numbers following the GOTO tokens are coded in ASCII, whereas the line numbers at the beginning of a line of text are coded as two-byte hex numbers. Fortunately, the BASIC interpreter has rountines built in to do these conversions back and forth between ASCII and hex. The locations of these and other routines called by this program are given in TABLE 1. Another problem encountered was locating some page zero registers, essential to 6502 programming, which are not altered by the BASIC itself. In some cases, I use space in the line buffer at 000A-0059, but this cannot be done in the section of the Program which uses the line buffer for its original purpose, i.e., inserting a line in its proper place in the BASIC text.

This program uses very little RAM, since no tables are created.

PROGRAM OPERATION

The program first sets or clears a flag, depending upon entry point (DCM 8181 or 8184), since entry point determines whether the renumber job is standard or custom. It then checks to see if sufficient memory exists to allow for insertion of spaces for as many as five digits for GOTO line numbers. An error message (see TABLE 2) is generated if there is less than one page available for this enlargement of the program. Then, each line of text is moved into the line buffer, and if a GOTO, GOSUB, or THEN (followed by a number) is present, spaces are inserted and the expanded line is inserted by BASIC's own line-insertion routine into the text area, just as though you retyped the line on the keyboard. Any lines too long for this expansion produce an error message before any harm is done to the program. BASIC's own error routine is called to print these messages! The "TOO LONG" message is a shortened version of "STRING TOO LONG" used by BASIC.

In the text, all statements are compressed into single-byte tokens, which I have listed for your reference in TABLE 3. For example, GOSUB is hex 8D, THEN is A7, etc. This program searches out all the 89, 8D and A7 tokens. Getting the proper ASCII numbers after these tokens requires conversion of the ASCII to hexadecimal and searching for a matching line number in the text area. If no match is found, the guy evidently had a GOTO pointing to a non-existent line number, so we flag this in the text by an opening parenthesis, such as:

```
GOTO(
GOSUB( :X=X+1
IF A=B THEN(
ON X GOTO 1234,(     ,5678,9987
```

When the progra is listed or run, the need for correction is obvious. While we are searching for a matching line number, we keep track of the new line number which corresponds to the current position in the text, so that when the match is found, the new line number can be converted to ASCII and placed directly into the text.

The actual resequencing process which follows is an anticlimax, because it requires so little coding (1E16-1E3E). When the entire renumbering job is done, we jump back to BASIC's warm start location.

USING THE PROGRAM

If you would like to renumber your program with the standard starting line number 100 and increment by 10, simply type SYS8181, which directs the program to hex address 1FF5. If you would like to choose a different starting line number or increment, POKE the desired values at the addresses shown in LISTING 2, and type SYS8184 to enter the program at 1FF8. If your BASIC program is long, it may take 3-4 seconds to complete the renumbering job. After renumbering, running the program will generally write over the renumber code, since it occupies the same space as some BASIC variables. The only precaution to be taken in renumbering is to avoid line numbers which exceed PET's limit of 63999.

ROUTINE ENTRY POINT (HEX)	FUNCTION AND IMPLEMENTATION
C359	Print an error message from the message table. Enter with X containing the location of the message relative to C190. Message terminator is ASCII having bit 7 on.
1F00	A duplicate of the original BASIC line insertion routine located at C3B4, except for the exit jump. Enter with the line assembled in the line buffer 000A-0059 with 00 as line terminator. Also, the character count must be in 005C, and the line number (hex) at 0008/9.
CCA4	Evaluate an expression whose beginning address is in 00C9/CA. We use this sub to convert from ASCII to binary, with the result appearing in the floating accumulator 00B0†.
DB1B	Convert fixed number in 00B1/2 to floating number. Enter with X=90 and carry set.
D6D0	Convert binary value, such as line number, in floating accumulator to two-byte fixed number and place in 0008/9.
DCAF	Convert floating number at 00B0† to ASCII and place in a string starting at 0101, preceded by a space or minus sign at 0100 and terminated by 00.
C38B	BASIC warm start. Prints READY.
CA27	Print message. Enter with ADH in Y, ADL in A. Message is ASCII string enough with 00.
DC9F	Print the decimal integer whose hex value is in microprocessor registers A and X, for example, a line number.

TABLE 1 - BASIC ROUTINES USED

MESSAGE	INTERPRETATION
CHECK FOR GOTO(ETC	Successful renumbering.
120 ? TOO LONG ERROR	Line 120 is too long to renumber. Break into two or more lines, and renumber again.
? OUT OF MEMORY ERROR	Program too long to renumber.
? SYNTAX ERROR	Attempt to RUN program with GOTO(remaining in program, or attempt to renumber with one of these in program text.
GOTO(GOSUB(ON X GOTO(IF A=B THEN(	The opening parenthesis in the text represents attempt to reference a non-existent line number.

Note: Lines of the following form are likely to cause a TOO LONG error:

100 ON X GOSUB 1,2,3,4,5,6,7,8,9,10,11,12

CLASSIFIED ADS

ZIPTAPE loads 8K BASIC in 15 seconds! Slower than a speeding disc? Sure, but it only costs $22.50 plus $1.00 S&H. $3.00 extra for software on KIM cassette. Described in MICRO #6. SASE for info. Lew Edwards, 1451 Hamilton Ave., Trenton, NJ 08629.

ADVERTISE in MICRO for only $10.00 !!! A classified ad such as the one above, may be run in this new Classified Ad section for $10.00. Ad may not exceed six lines, and only one ad per person, company, etc. Must relate to 6502 type stuff, and ad must be prepaid. You will reach over 6000 readers!!!

The TARGET for users of Rockwell's AIM 65. Find out how to use the printer, keyboard and display. Reviews of upcoming Assembler and BASIC in ROMs. Six bimonthly issues for $5.00 US and Canada ($12.00 elsewhere). Contact: Don Clem, RR#2, Spencerville, OH 45887

LOCATION		
HEX	DECIMAL	VALUE TO BE POKED
00DB	219	Low order starting line number (wieght 1)
00DC	220	High order starting line number (weight 256)
00DD	221	Increment desired (1-255)

Example: POKE 219,232
POKE 220,3
POKE 221,50

This will give a starting line number of 3 x 256 † 232 = 1000, and following lines will be incremented by 50.

TABLE 3

TOKENS (shorthand used in BASIC text)

ENTERING THE PROGRAM

The hard way to load the program into your PET is to convert my hex listing into decimal and POKE each byte into memory. This is, of course, a challenge to your accuracy and diligence, although it may take only slightly longer than renumbering by hand. It is only a little easier to write a BASIC program which will accept the hex data and convert to decimal, with the hex incorporated in DATA statements and obtained by the READ statement. With this alternate, the program can be recorded for future use.

To make loading painless (excpet for the wallet), I have arranged to make tapes available through NAIL*, Drawer F, Mobile, Alabama 36601. These tapes load the machine-language program directly into high memory. Ask for "SYS8181" and send $18.18. By the way, they also have a dandy PET monitor called SYS7171 for $29.71, which has machine language capabilities, the ability to co-reside in RAM with BASIC programs, but also has the very helpful feature of being able to APPEND one BASIC program to another, just like the big boys do, with interleaving of lines. Like SYS8181, it uses the BASIC line-inserting routine to do the merging, just as though you typed all those new lines on your keyboard. I used a version of this monitor to develop SYS8181. If there is sufficient interest out there, I may develop a ROM version of SYS8181, but you will have to be a hardware buff to wire it into your PET.

Since PET BASIC was written by the same company who write APPLESOFT and is similar, some APPLE owners may wish to obtain a disassembled, documented listing of this renumbering program from me for $5.00.

Apple FORTH
Pet FORTH

FORTH is a unique threaded language that is ideally suited for systems and applications programming on a micro-processor system. The user may have the interactive FORTH Compiler/Interpreter system running stand-alone in 4K to 6K bytes of RAM. The system also offers a built-in incremental assembler and text editor. Since the FORTH language is vocabulary based, the user may tailor the system to resemble the needs and structure of any specific application. Programming in FORTH consists of defining new words, which draw upon the existing vocabulary, and which in turn may be used to define even more complex applications. Reverse Polish Notation and LIFO stacks are used in the FORTH system to process arithmetic expressions. Programs written in FORTH are compact and very fast.

APPLE II COMPUTER **$34.95**
PET 2001 COMPUTER **$34.95**

Apple PIE

PIE (PROGRAMMA IMPROVED EDITOR) is a two-dimensional cursor-based editor designed specifically for use with memory-mapped and cursor-based CRT's. It is totally different from the usual line-based editors, which were originally designed for Teletypes. The keys of the system input keyboard are assigned specific PIE Editor function commands. PIE includes the following features: blinking cursor; cursor movement up, down, right, left, home, plus tabs; character insert and delete, string search forwards and backwards; page scrolling; GO TO line number, plus top or bottom of file; line insert and delete anywhere on screen; append and clear to end of line; move and copy buffer.

APPLE II COMPUTER **$19.95**

All orders include 3% postage and handling. Apple II is a registered trademark of Apple Computer, Inc. Pet is a registered trademark of Commodore International and TRS-80 is a registered trademark of Radio Shack. California residents add 6% sales tax.

the pet program.

1 **GRAPHICS PAC** Quadruple your PET's graphic resolution. Do not be stuck with the PET's cumbersome 25X40 1000 point display. With the Graphics Pac you can *individually control 4000 points* on screen. It's great for *graphing, plotting,* and *gaming*. The Pac is a set of three programs with full documentation. PLOT places coordinate 0,0 in the screen's upper left hand corner. For more sophisticated applications the Pac includes GRAPH which plots point 0,0, in the center of the screen allowing you to *plot equations in all four quadrants*. As a *bonus* a Hi Res Doodle game is included. All this on a high quality cassette for $9.95

2 **ASSEMBLER 2001** is a full featured assembler for your PET microcomputer that follows the *standard 6502 set of* machine language *mnemonics*. Now you can write machine code programs. *Store* your assembled programs, *load* them, *run* them, and even *list* your programs and *various PET subroutines*. Unlike other assemblers this is one program! You do not have to go through a three tape process to edit and run a program. Of course to make more space you can trim out the features you do not need. Assembler 2001 allows you to run through the USR of SYS commands. This valuable program is offered at $15.95.

3 **BIKE** An *exciting new simulation* that puts you in charge of a bicycle manufacturing empire. Juggle inflation, breakdowns, seasonal sales variations, inventory, workers, prices, machines, and ad campaigns to keep your enterprise in the black. *Bike is dangerously addictive*. Once you start a game you will not want to stop. To allow you to take short rest breaks, Bike lets you store the data from your game on a tape so you can continue where you left off next time you wish to play. Worth a million in fun, we'll offer BIKE at $9.95.

4 **PINBALL** Dynamic usage of the PET's graphics features when combined with the fun of the *number 1 arcade game* equals an *action packed video spectacle* for your computer. Bumpers, chutes, flippers, free balls, gates, a jackpot, and a little luck guarantee a great game for all. $9.95.

5 **SUPER DOODLE** Give your PET a workout. This program really *puts the PET's graphics to work*. Super Doodle lets you use the screen of your PET like a *sketch pad*. Move a *cursor* in eight directions leaving a trail of any of the 256 charactrs the PET can produce. New features include *an erase key* that automatically remembers your last five moves, a return to center key, and clear control. *Why waste any more paper*, buy Super Doodle for only $9.95.

6 **DRIVING ACE** Non stop excitement with a fast moving, high paced version of your favorite video arcade racing games. Shift up! Shift Down! Watch your gas, and be careful on those hairpin turns. This dynamite tape has the two most common arcade racing games specially adapted to run on your PET computer. Driving Ace simulates an endless road packed with tight turns and gentle, but teasing, twists. Starting with fifty gallons of gas, how far can you go with a minimum of accidents? Grand Prix places you and your car on a crowded racing track. Race the clock and be careful steering around the fast but packed Grand Prix track. $9.95

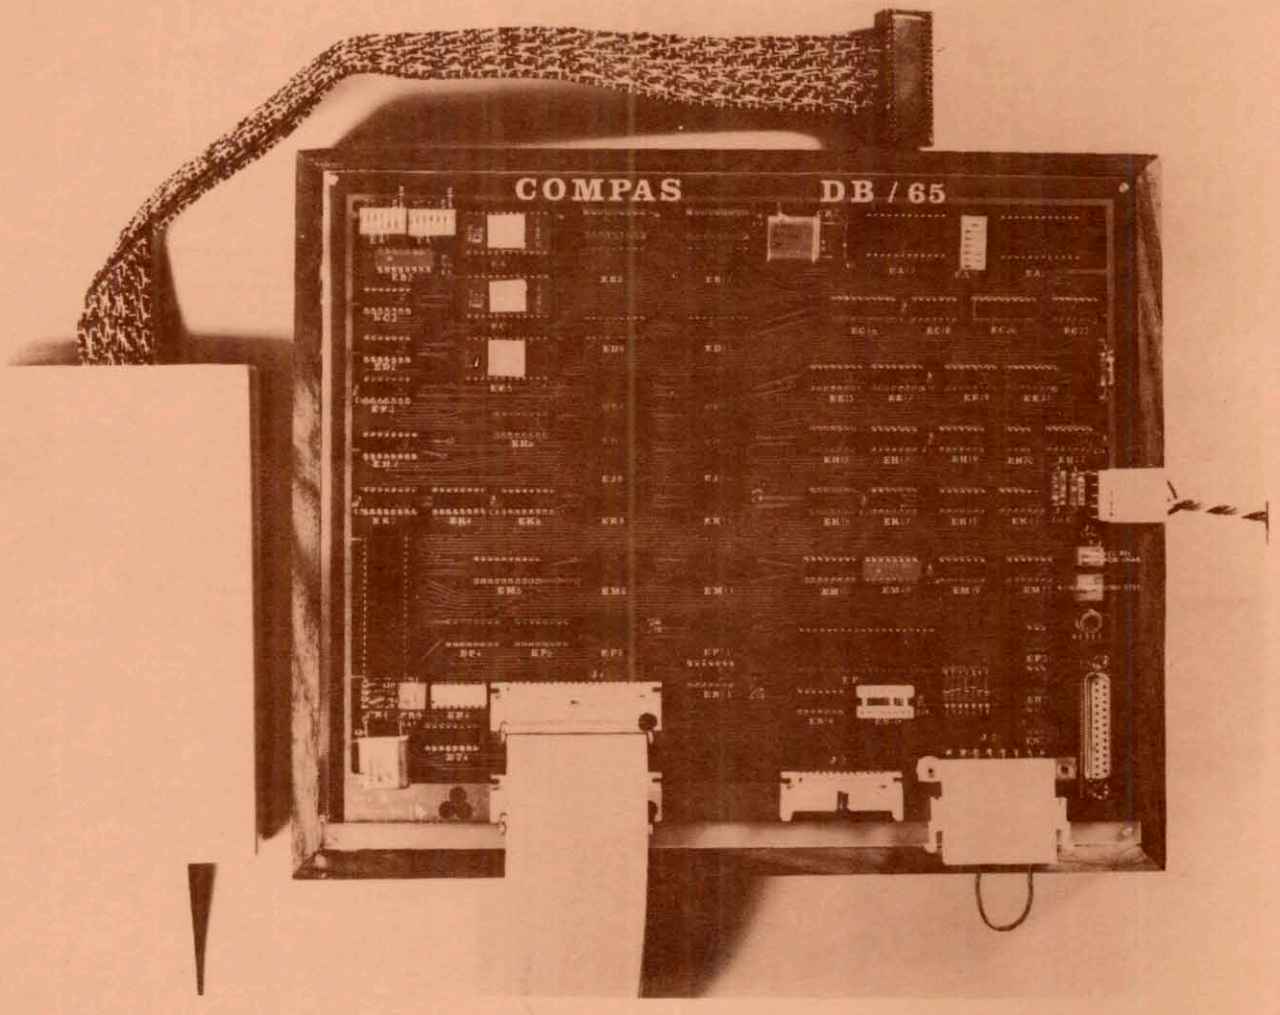
515/232-8187

DB/65

A complete hardware/software debug system for the Rockwell, Synertek, MOS/Technology 6500 microprocessor family.



Features

* Standard in-circuit emulator
* Hardware breakpoints
* Single step mode
* Eight software breakpoints
* Real-time software breakpoints
* RS 232C or current loop terminals
* Symbolic disassembly of user program
* Serial/parallel load capability
* Program trace of instructions and registers
* Prom resident debug monitor
* Software history of instruction addresses
* 2K ram standard with sockets for additional 6K if required
* Scope sync output
* User NMI and IRQ vectors supported
* Write protect
* User program may reside in high memory

SINGLE QUANTITY PRICE = $1450
