Lightpens reviewed
Lightpens might appear to be very attractive devices, but they do carry a weightry price-tag. What can they do? Are they worth the

User Profile: Fred Reid and the Fretful Pet

Fred Reid's enthusiasm for building and repairing guitars is matched only by his passion for computers. Bohdan Buciak went along to his diminutive workshop to find out how an ageing Pet helps to make his guitars sound better.

Vic enthusiant Mike Apsey ("who needs a 647") has been using
Vics of various demeanour for a while now. We prevailed on him to assemble a potpourri of tips and tricks from what he's learned.

How not to fall off the table with your 64

"TOPO and FRED mark the arrival of the most exciting and practical development of silicon technology since the introduction of the Prism's personal computer". enthuses moustachioed development man, Daubney. Prism? You know, the people making a fortune distributing software for the Spectrum. But who are TOPO and FRED? They're

Androbots, of course.

floor, a diminutive three feet of plastic, wiring and a few chips, Will he he moved by the nounding infectious disco beat that suddenly surges up? Scantily-clad dancing cirls swarm on and perform un likely contortions around him. He stands unmoved, as impervious to their vacuous gyrations as your correspondent. He has no arms, merely sockets into which robotic arms will soon be placed (when they're ready) He has no eyes morely a pair of plastic dots in the inscrutible face where light/heat/distance sensors will be placed (when they're ready). Maybe the light-show will move him. Prism shapes float, dart and quiver around the dancefloor. A tantalising laser plays on his expressionless face - but his robotic impassivity remains intact. Did

Take your places, dim the lights for the wierdest most phantasmagorical show in town. It's 'Prism presents the Androbots' to the world. Well, not the whole world, just the world as represented by a mass of gawning dealers and presspeople in London's newest, zaniest nightspot - the Hippodrome in Leicester Square. The man under the spot: William Woolard, famed for making science sound as easy as falling off a high-tech log Lengthy panoramic oration, lots of video, megawatts of music and then ... throw off the covers, sound

the fanfares - cue TOPO! Woolard is a distinguished Tommorrow's World presenter; TOPO is distinguished by his wheels. TOPO stands alone on the danceeone forget to put the batteries

Enter Bob Denton, Prism's MD. Will the force of his lofty position head and he moves, he turns, he speaks (actually, there are some control buttons on the robotic cranium). He can be controlled by an infra-red link to a computer but he wasn't. He just trundled to the front of the stage.

Prism's press blurb announces that he can already speak and move; that he will be able to mow your lawn, do your hoovering. fetch and carry for invalides. But there's more: "it won't be long before an Androbot can mix you a drink (shaken not stirred you fool) fetch your slippers and then perhaps settle down to a quiet evening's ironing" ... and all for a domestic £1,500.

Well, we'll have to take their word on that Maybe FRED (a mere tunior in the Androbot family) is more in your price-range. FRED stands just one foot high. He's also controlled by infra-red beams (but he wasn't) or a link to your home computer (but he wasn't). Ah. get-

FRED's claim to stardom is that he can hold a pen. He can draw the namerus vou've created on your computer screen. He can move around at five inches per second in a four foot area. He can say 45 words too Back to the blurb: *FRED rolls through life on a heavyduty wheel assembly, vigilantly watching his step with a set of downward-looking sensors. He's on the alert for the table edges he knows he should avoid ..." Get off the table. FRED

FRED will adorn your home for £200 and become a bosom comnanion to your Commodore 64 very soon. But how soon? Prism is 'presently implementing' a package for that very machine. What about the other Commodore home stalwart? Sorry, FRED and Vic won't be making friends.

Prism will be marketing TOPO and FRED through a national network of dealers. TOPO is promised to arrive during February; FRED is booked to make an appearance in April So you can according to the future today" ... so what fun will we be enjoying in the future? Answers on a postcard. And turn in your grave. Doctor Who.

Prism Consumer Products is on 01-253 2277

Ask away: CAP, one of Europe's leading information systems companies, has made what it calls "a strategic move" into the educational software market by stake in Applied Systems Knowledge Ltd. ASK specialises in learning programs for schools

and home-based micros, and has some good stuff for the Vic CAP paid £100,000 for its 32 pere cent stake in ASK and has an option to increase its holding during the next five years ...

Number blunder Apologies to Darren Bird for getting the phone Software Library wrong in ou last issue. The number should have read: 0332 831457.

Tape Tip: The most commo problem on any computer cassette unit is flattening of the nubber-covered pinch roller happens when you leave it in PLAY mode for too long; and when the Vic or 64 has finished a cassette motor - with the pinch roller still pressed against the roller can cause some variation Moral: hit the STOP button when

Simons' Bug: When printing out listings using Simons Basic, do manual - instead type all printer commands on one line. For instance

OPEN 4.4: CMD4: LIST

To print more than one listing you have to close all channels. again, and re-type the print instructions. If you don't use this procedure you'll get a line feed only on the printer ...

Iolly Roger Dept: Commodore's Hardware, which sold an add-on that allows you to copy cartridges on to tape, has apparently ended in an out-ofcourt settlement. The bloke in question, Peter Goss, has got some freelance work from Commodore out of it. All of which is a bit of a shame, since the key legal point was therefore not settled: Goss argued that it wasn't him who was doing the pirating, it was his customers, responsibility for what the punters do - even if the product tends to encourage obviously illegal actions? The debate continues ...

Looks like 1984's going to be a bumper year for robots. Maplin Electronic Supplies has now acquired an ambulent piece of hardware called HERO, which is developed by Heathkit, an American

Maplin itself is undertaking to interface HERO to "any popular home computer", according to its blurb. It's already succeeded with Atari and Spectrum machines but it looks like having a few problems with the Vic and Commodore 64 Their 'unusual' interface means that a fair amount of jigging around (converting to RS-232 and then to 8bit parallel using a UART) will have to be done to get HERO to respond to commands. But don't be dismayed; HERO's price may dampen your enthusiasm a little.

An unassembled HERO will cost you £1,599, the idea being that putting it together teaches you about electronics (the fully-fashioned version costs £2.500).

HERO has speech and distance sensors, and Maplin hopes to develop a speech recognition capability for it. Controlling it can

be done directly from the computer's keyboard using an infrared or wire link. It can be used independently too, by storing programs in its memory. But it's primarily aimed at teaching progdefinitely not a toy.

Maplin is on 0702 582911

Poetry Corner: A grafitti poen and quoted by Rex Malik in Microcomputer Printout magazine: "I am sick and tired of this machine/ I wish that they would sell it/ It seldom does what I want/ But only what I tell it."

MCP, incidentally, is reportedly up for sale - which is a bit of a shame. It started life as the Pet-only Printout, broadened its scope into a good Fun-'n'-Fact mag, was sold to a big-deal publisher called Benn Brothers a year or two ago, and is now apparently on offer again to interested parties.

Hypermarket pennanco

Some friends coming round to dinner? Got to get some shopping done? No problem: pop down to ket - it's open until 8pm. Trundle your trolley past the deli counter, past the tinned veg ... Oh look! A whole stack of Commodore SX-64s. Must get one of those.

Hypermarkets are supposedly full of bargains. No bargains here, though. SavaCentre's selling the machine for what it calls "a typical hypermarket price"; but in fact it's it in the trolley anyway. Now for the real shopping - if there's any more room in the trolley.

Apologies

In our January single-line competition results, we inadvertently printed one entry twice - thus depriving Filippo Pozzi of Voghera Italy, of the due credit. Here's his winning entry: and as we said before, it's a good joke ...

198.1: POKE 6410 PRINT "ICLRIPRESSFITO...DREAM": WAIT198.1: POKE 644,128: 272688

Two for the price: Audiogenic, which has taken to calling itself and Commodore 64 software house in the UK", has launched some 'dual program cassettes' one side of the cassette for Vic. the other for 64. Thus the same cassette satisfies both Vic and 64 mers, with corresponding savings in cost", says Audiogenic macmanimously. Two cassettes you know what we think

700 extended: The latest from those clever people at ICL Software is a handy collection of utilities for the 700 (yes, the 700 is alive and well: and it is being shipped - we hear). The 700 WORKSHOP is a plug-in cartridge containing a whopping

120KB of goodies in ROM. The price is £120, for which you get some extensions to Basic: some toolkit functions for program development aids for machine code programming: and "the ability to run soft-loaded Basic of the user's design". Sounds good. JCL is on 0892 27454

64 talks to CBM: Also from JCL is an IEEE 488 cartridge for the 64. Yet another gismo that lets the 64 use the Pet/700 line's disks, printers and other peripherals, Maybe, but this one considering the extras you get operation instant screen dumps (nust press CTRL-P), 'autoboot' to load a program automatically

64 as Typewriter: This neat trick VIC-UPS, the eager and active club in Western Australia. It lets you use a 64 and a printer as a typewriter - and it works!

SX on Show

by Henry Deckhand

Eager train-loads of computing people (mostly computer journalists) breezed into Birmingham's National Exhibition Centre for the first (of many) all-star hi-tech spectacles of 1984

- The Which Computer Show. New machines, new peripherals, new software; but even in the supposedly fast-moving world of computing, the wheelers and dealers stay the same. They've done it all before, they'll do it all again...

that Commodore grabbed a major share of Show real-estate and gave pride of place to the confident (hopeful?) that the 64-

With its £895 price-tag as well, it may need a little help. No multicolour blurb. So what do you

Giving it all away

There's Old Faithful, the Easy 1541 disk drive, at least until next financial planning package that's new to us. And just to make the point that the SX-64 can be used for fun too, there's High Flyer, "a challenging business simulation

There's more freebies for other being bundled up in a selection any one and you get "£1.000 worth of free software". That amounts to three business packages: CalcResult, Superbase Catalogue and sound like being

Commodore also announced a communications modern for the SX-64 - but it wasn't on display, would you believe. It will "shortly be made available" says the happens, it will give access to

electronic mail. Telex and public/ 20 private databases like Prestel. Since the machine itself was so reluctant to appear in this country, you could be in for a long wait. No-one knew much about it, but presumably it'll be a low-cost cartridge.

New for old

The new MPS 801 dot matrix printer (also being reviewed by us) was on display, though. It's replacing the 1525 and, despite a better specification, costs the same (£230). It's print speed is 1525's 30cps. It will print doublewidth characters and has a facility for designing unique graphic symbols (it will produce all the Vic and 64's graphic characters too). Still no true descenders, though,

Commodore demonstrated its increasing commitment towards software by allowing seven share its stand Precision Software (who wrote Easy Script) demonstrated its new Super Office package, which integrates data management with word processing facilities - just like on a real computer. It's scheduled for release at the end of January

present: and no price yet, either. Looks good, though. Kobra was there with its prestigious acquisition Microsoft's Multiplan spreadsheet package. The company has exclusive UK rights for the Commodore 64 version which it's

only for 700 and 8000 series at

That is going to make the 64 an even more viable business machine - we'll be reviewing that one soon, too. A preliminary

glance, though, shows that the package and documentation set new standards in the 64 world. As you'd expect from Microsoft which makes much of its money IBM-PC - where presentation is almost more important than the

Kobra must be doing a creat deal of gleeful handrubbing. leading spreadsheet package houses. But Commodore may not be mite so pleased in lune of last year it was reported to be negotiating marketing rights with Microsoft for the same product and that came to naught Apparently Commodore's

proposal for a version of Multiplan (lower than Kobra's present price, as it happens) and mass-marketing strategy didn't suit either Microsoft or its existing dealers. But, no doubt, Multiplan will soon be Commodore-Approved. Certainly

should be. Handic shouldn't be overloved either. The Swedish company is

just opening its own UK office to competitor, CalcResult ... which is had to do because Kohra

relinquished its own deal on that and other Handic products late last year. Now we know why

Overview

The Which Computer Show isn't intended for home computer enthusiasts of course But it's interesting to see where the computer business is going computer boom, and in particular the volume-retailing features that

Commodore took a big stand revive its flagging position in the business systems market: but the technologically dowdy alongside

the zillion 16-bit hi-res IBMcompatible micros The SX-64 might be what the user hopes on; certainly the good, and the freebies in the SX-

business buyers. work? Will the SX-64 sell in quantity? Is Commodore really

Fire, theft and coffee in the Insuring your home computer kevboard by Bohdan Buciak

If you're a responsible and judicious person, you've probably already insured your house and beloved chattels against the Great Perils - fire, flood, earthquake and other nasty occurences. Since your computer has become as valuable a part of your home as the television or grandad's cigarette-card collection, that will require insuring too

But how do you go about insuring your Vic or your 64? What levels of cover are readily available? And how much will you finish up paying? Bohdan Buciak has been wading through an assortment of general household policies and some specialised

computer policies.

Since your computer probably spends most or all of its time in your home, it's prone to loss or damage in the same way as anything else in your household. So including it in a general household contents insurance policy sounds like a bright idea. In fact, the majority of home way. But is that ademiate?

Household contents policies

Most of the major insurance companies now mention the word 'computer' in the wording for their household policies having recognised, at long last, that computers can no longer be ignored. But you've got to read carefully (not only the brochure but the policy itself) to see what is and isn't covered.

Ler's start with the Home Plus policy from the Norwich Union, a popular home insurance policy and one of the easiest to understand in terms of its computer cover. In the section on

principal risks (fire, flood, theft, storm etc. against which all your household contents are insured) there's automatic inclusion of accidental damage to your computer. That's pretty sensible because accidental damage is the most valuable cover you'll need - and it comes at no extra But there are a number of

restrictions (which is reasonable because you're not paying very much). For example, you're only covered for accidental damage in your own home.

Electrical or mechanical damage isn't covered; neither is wear and tear, or damage caused by repair or incorrect electrical connection. On top of that, there's no cover for damage to software. You may want all that covered - but more about that later.

HomeCover from Combill

Insurance gives virtually identical cover. In both cases you don't need to specify what computer and what peripherals you have. But if you acquire them after taking out the policy, do make sure that their value is added to the sum insured. Remember. you've signed a declaration saving that the sum insured is not less than the replacement value of your Contents. Adding a computer to an existing policy may increase your premium a lit-

Cost of cover

Household insurance rates differ from area to area. Obvious innercity areas entail the highest risks and consequently the highest rates. But an average rate would be £3.50 for every £1.000 insured So adding a £800 computer system to a policy would increase your premium by about \$2

And with some policies, like the Hearth and Home policy from Prudential, you don't get automatic cover for accidental damage to the computer within the basic policy at all. The Pru does have an 'accidental damage section and that's the way to cover your Vic or 64. But it also covers the Contents as a whole: that almost doubles the premium. though and you may not want to pay to cover all your possessions in that way.

All risks

The Prudential gets around this problem by mentioning the computer in another section, 'All Risks', there it comes under the heading of home leisure equipment. The general idea of All Risks is that you insure only items that need special cover in this way. With the Prudential, you get cover for loss or damage from almost any cause - but it's still confined to the home.

Needless to say, you can't get this cover unless you've also got the general contents cover with the Prudential.

The extra premium works out

The extra premium works out at around \$1.90 for every \$100 insured. But the minimum sum is \$500, so you'll need a few peripherals or a more expensive machine to take advantage of such cover. There's also a \$10 excess which means you pay the first \$10 of any claim.

By the way, be careful about excesses – some can be as high as £25. That's about the average cost of computer repairs. So it may not be worth your while claiming.

With the Prudential, cover for All Risks is on a new-for-old basis if the computer is beyond repair. On the basic policy, it's optional. The Cornhill is equally flexible; it provides for claims settlement on an indemnity or a new-for-old basis. "Indemnity takes into account gradual deterioration and wear and tear. It's a bit cheaper; but you'll have

It's a bit cheaper, but you'll have to pay something towards a new computer or a little of the repair charge. Norwich Union, on the other hand, provides only a new-for-old policy. It will consider offering All Risks cover to home computers, but only by assessing each case individually.

That's really the extent of

That's really the extend cover possible on a sensible of a sensible of a sensible of policy. Certainly Corthill work extend accidented damage cover to transit or use outside the home. That applies to most other companies too. Generally, if you take your companies too. General Risks mentioned above. You've overend if the instead of these General Risks mentioned above. You've overend the understanding or, any, damaged by administration or, any, damaged by administration or, any, damaged by the but not if you drop

So far, we haven't mentioned software. This is a problem area for home insurers and they prefer not to get involved with it. Choce again, you're covered for general risker, but making a claim probably wont be worth while if the value of the software lost is smaller than the excess payment specified in the policy. And how do you assess the value of programs you've written yourself? Smillarly, you worth be able to claim for accidental damage or examine of your soft-

If you're now grumbling that household policies can't provide the cover you need, there are alternatives: maybe a specialized (and more expensive) personal computer policy is the one for you.

But wait have you got the Golden Key household policy from Commercial Union? There's nothing much to distinguish this from like policies ... encept that it will insure you for repairs if your computer breaks down. The coeff For a \$500 system, you'll pay \$12.50 on top of your existing premium. The frawback is that you pay the first \$25 of any claim.

Specialised policies

Apart from the basic cover provided, the major drawback in including a computer in your household policy is that you're truck with the existing wording in the policy. You could always change your policy, bit that sounds rather drastic. Many people don't have or need a household policy.

A specialised computer policy will probably give geater depth of cover - at a price. The Comhill, for one, offers an easy-to-understand personal computer policy specially designed for home and educational use. It's split into two sections, hardware seed software.

On the hardware side, you're covered for All Risks (including accidental loss and damage) to the complete system – processor, printer, disk drive, even a display if it is used solely for the computer. Another tue-ful feature is that breakdown is covered too – though you pay the first £25 of, any claim. Similarly there's that namy old £10 excess on a loss or darmace claim.

But this policy does cover software, tapes and disks (including information stored on them) are insured for loss and damage arising from risks insured on the hardware sarrism

damage arising from risks insured on the hardware section. Again, there's a £10 excess. Finally, cover on both hardware and software applies not only to loss of damage occuring at the address the

naroware also sower appear occurring at the address the system is usually kept, but in transit too and indeed anywhere else (albeit temporarily) in the Unjeel Kingdom. So you could aske your Vice on holiday to also your vice in the concovered for theft in both instances you.

That sounds comprehensive

That sounds comprehensive and reasonable. What will it cos you? If you've valued your complete system at £500, cover for All Risks and breakdown would cost you just over £20 pe year. If you docide against insuring for breakdown, the

year. If you decide against insuring for breakdown, the premium drops to £7.50 (breakdown only insurance would cost £15.40).

Comparing the options

How does that compare with a similar personal computer insurance scheme from Graham Brown to Guildford? This policy also covers All Esids and breakdown, and is aimed at personal and educational use. It as no provision for covering software, though. Primarily, hardwaye cover is the same at the home address.

the same at the home address. But the Graham Brown policy only covers the system outside the home if it's in an educational establishment or your office logs or damage in transit to and from those places is also

from those places is also covered. But, unlike the Cornhill policy, theft whilst in transit is not covered. Graham Brown's policy also

stipulates that the computer must be no more than two years old when cover is taken. Cornhill doesn't specify any age.

For the same £300 system, Graham Brown quotes a premium of £15. That's cheaper, but you get less cover and you don't have the advantage of being able to claim for software. Both have a £10 excess tagged on to each Yer pays yer money ...

Finally, let's look at the Hi-Tech Supercover scheme from Entertainment and Leisure. This is a general electrical enumeration of insurance policy which works out

insurance policy which works or pretty well for home computers. It's almost identical to Cornhil's, offering full cover for accidental loss or damage (including fire and theft) to the equipment whether it's kept at home or anywhere in the UK Likewise, includes theft in transit.

There's also similar cover for software, whose value you meetly addy, excedental damps, meetly addy, excedental damps, does not cover enaure of apse or disks — no immance policy of this level will give you that kind of cover. You'll have problems claiming for software you've written yourself, too. Commercial software is pretty simple to value, but the insurance company wegild have to do some investigations.

would have to do some speestigating if you claimed that the brilliant new version of Frogger you've written (you valued it at £1,000) had gone up in smoke. Like the other specialised

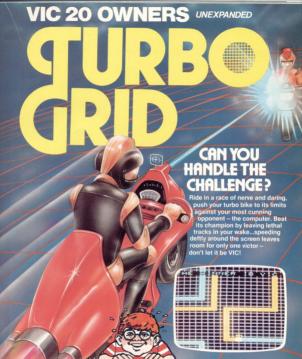

Like the other specialised policies, the H-Tech policy gives you a number of cover options. The cheapest rate is for cover restricted to your hopes or office, an annual premium of \$32 for the \$500 system. Effending the cover to anywhere in the UK and their from a car increases the premium to \$43.

The Hi-Tech policy is certainly the pricies to the three but it has features which the other two doot mention. Like giving a no claims discount, free cover for up to 31 days in Western Europe (take your Vic to Bendorm?), and paying for the expense of a hiring equipment as a see great the cost by paying over three months.

The small print

The dubious nature of small print in insurance policies has reached legendary proportions. And it is true that merely browsing through a policy won't give you the full picture – there are always exceptions and conditions.

The most frequent one is the excess payment; you pay a fixed amount on each claim. Another example of the genire, in the H-Tech policy, is that thef from a vehicle is covered ... but not if it has a soft or removable top. That's made quite plain in the

policy but it does restrict your scope a little.

Conclusions

For the average home user, including a computer system within a household contents policy should provide adequate cover cheaply—the premium won't appreciably go up. But for people who use computers outside the home, whether at a club or educational establishment, the risks for loss

These are the insurers we looked at:

and damage invariably increase. So a more specialised computer policy would be the answer.

But the real crunch comes when a disaster has occured and you wait for the insurance company to pay up. Here, reputation may account for more than policy wording. Large companies tend to pay that's what you pay your premium for - getting your machine repaired or replaced as quickly and painlessly as possible.

Shedding some light (on the matter)

Three lightpens reviewed by Bohdan Buciak

The lightpen is yet another peripheral home computer buffs are being invited to add to their 'wanted' list. The device detects a point of light on a screen and either changes the display or inputs information from it to the computer. But it's becoming popular in the home - not just for drawing and game-playing, but for programmers to extend the range of their work.

The DAMS

Pixstik We'll start with the Dams lightpen (or the Pixstik, from Dams subsidiary Computapix), with its drawing cartridge. The latest version is claimed to be "Greatly improved" - a preliminary pinch of salt there, but it turned out to be quite true. It comes in two versions: for the Vic and the 64. Both come with a plug-in cartridge, a weighty sheet of instructions and an

We acquired the 64 version which is simplicity itself to use. The program loads immediately. as you'd expect from a cartridge, and you're ready to draw as soon as you've plugged the pen into the first games port.

even weightier £25

price-tag. So lets

plug one in.

One small gripe here; Dams might have used more flexible cable. The pen's plug is pretty large and it doesn't fit the port very securely. Pulling on the

Quick draw

The drawing functions and choice of 16 colour blocks are displayed permanently on the screen, as well as x (horizontal) and y (vertical) coordinates. This is sensible as it lets you select quickly and easily.

That's done by pointing the pen to the appropriate spot and hitting a shift key. You're helped by a target-like spot which indicates the pen's position

anywhere on the working area of the screen. The coordinate dienlay is also a sensible feature

- but more about that later Apart from selecting drawing colours, you can change the colour of both the screen and the a light colour for the screen as performance. You're given a choice of three 'pens', which overcome the problem of colours merging when they overlap. You choose a different pen to draw inside an area already filled with

Shapina up

You're given a reasonable variety of standard drawing functions: line, triangle, rectangle, circle and ellipse. All shapes are quick and easy to draw. To draw a circle, for example, you need plot only the centre and a point on the circumference. Shapes can be either filled with colour or left as line drawings. Lines can be thin or drawn with larger blocks. There's also a 'paint' mode which you use freehand to get a speckled effect. But the freehand mode proper

is of next to no real use because the pen won't remain steady for long enough to give you a reasonable degree of accuracy. That's why you're given the choice of shapes: they're produced mainly through software rather than manual control. Without them, you'd soon get bored and frustrated. But even they can't be produced with

Time for a few home truths. Firstly, a really stable lightpen hasn't yet been produced for home computers. It's not all the manufacturers' fault: there are technological and computer limitations too. On top of that, the television set may not produce a bright enough image for the pen to read; dark colours don't emit enough light. Then there's static which builds up dust on both the screen and pen tip, making the pen difficult to control.

Dams has properly realised these limitations. So it has added a couple of features that compensate for the pen's lack of real drawing ability. They're called Bounce and Anir

both of them use the pen's rather clever memory ability. Dams has provided four memories for the pen. By going into Command mode (f7), you can store and recall four separate drawings. When you've memory, you can use the Clear function to clear the screen and produce another picture.

When you've got a maximum of four pictures stored, you can use either Bounce or Animate to display them in sequence at half second intervals. Animate will display the four 'screens' in a 0-1-2-3 sequence, whilst Bounce works in the same way but his directionally. If you've coordinated your four pictures the effects can be quite stunning. The manual very usefully gives you a blow-by-blow example to

This is where the x/v ordinate display becomes useful as it helps you calculate positions more accurately. But, as you'll know by now, it's virtually impossible to make the pen stay on a particular set of coordinate You can even save your eation on tape or disk for future display. But be warned: we

give you the general idea.

used disk and found the Commodore drive took a long time to load and save. Obviously that depends on the complexity of your drawing but it does mean that using tape would be too slow and tedions

Summing up Dams The Dams Pixstik is easy for

non-computer folk to use and its manual is good. But it will frustrate the more creative amonust you because it litters and shakes so much. Of course, you may want to use the pen in other ways (£25 is a great deal to pay for a mere drawing pen).

Dams has realised that, and has begun producing games cassettes for the pen. Three are already available for the Vic and 64, Flack, Tic Tac Tow and Melody. You could buy them separately at £5 each: or you can take advantage of a package that gives you the lot (pen, drawing cartridge, three games) for £29.95(we can't say anything about the games until we get them for review). Make your own mind up about the price

Summary.	Good drawing facilities by	i

limited scope for freehand work. Good manual. Only small range of games available.

Price-£25 (games cassettes £5 each)

The Stack lightpen

Let's move on to the Stack lightpen. which already has ten games available for it - but no painting software (Stack tells us that's coming in January). The pen isn't cheap either: it also costs £25. So what do you get for the money?

Again, we acquired the 64 version - which comes with an eight-page manual and a free game on cassette. The manual is fairly basic but useful: it gives a concise description of how a lightpen works, followed by two short programs for setting up the working area of the screen and displaying the x'y coordinates. If you've grasped all that (it's

all a little unnerving for a complete beginner) you then confront the touch control on the pen, followed by a program that lets you put a coloured square at will on the screen. That's as far as the manual takes you - not very far. The rest is uncharted wat-

One useful point about the manual is that it shows you how to calibrate your pen for a particular television; that should steady the jitters a little. The idea behind this was to allow you to alter x and y values in the program listing of Stack's games to improve the pen's performance. That would have proved a tricky task for many people. So Stack has wisely built an automatic pen calibration feature into all the lightpen games. You can point the pen to the calibration spot on the screen until the thank-you message ap-

Despite this facility, Stack's non was probably as littery as the one from Dams. It was slightly easier to handle thoug contact is made on the pen itself - by two touch-sensitive metal

Drawing the line

According to Stack most people don't want to use lightpens for drawing. It's backing up that perspicuity with lots of games tapes. Another reason is that

Under review:	Stack lightpen (for Vic and 64)
Supplier:	Stack Computer Services 290-298 Bootle Road Bootle, Merseyside L20 8LN 051-933 5511
Summary:	Wide range of games. Only few games use lightpen's features to the full. 'Paintbox' software available soon. Basic but concise manual.
Price:	£25 (games cassettes £5 each)

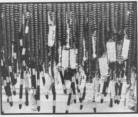

Stack has apparently realised present lightnen technology won't let you draw very well anyway - and that seems to us With its emphasis on game-

playing, you'd expect some pretty good examples for the lightnen. But the free game included in the nackage. Concentration, probably won't make you feel your money's been well spent. It's the wellknown turn-cards-over-re-

member-them-make-them-pairs game. And a pack of real cards comes a little cheaper.

The same goes for a few more of the games Stack's made available (they cost £5 each): games like Othello, Draughts and Seek and Destroy. They're all well-known and probably easier, more enjoyable and much less expensive to play with pen, paper and plastic. Admittedly, Stack offers some good visual and sound effects; but it does

make you wonder why they

More fun and games

A few games, like Simon, are more impressive and actually make good use of the lightpen as a pointing device (when it decides to behave). Lost in the Labyrinth also uses the pen in this way. It's an eccentric game though, and probably not to everyone's taste - though it certainly has more lasting value than some of the offerings

Another good and more intelligent game is Crossword Twister. This again uses the lightpen to the full and displays some brilliant effects, like letters drifting down the screen into the square you've chosen on the cross-

Leaving content aside. Stack must be congratulated on its There's ample on-screen instructions and all the games play marvellous music. On some, that's the best feature. Seek and Destroy, for

example, gives you a Baroque-ish rendering of the Dambusters theme - very appropriate, very

Stack says it is continually developing games for the lightpen - which is encouraging if you've bought one and wondered whether it was all worth it. The earliest games, though, are frankly boring on average, and they don't really justify a lightpen at all. More recent offerings are much better and benefully will continue to improve.

But if you don't like playing games or drawing you could certainly incorporate the Stack pen into programming. Despite the lack of in-depth explanation in the manual, an experienced programmer should have no real trouble.

The Datapen

But maybe you don't like drawing or game-playing? Maybe you want a down-to-earth pen that should be cheaper because it doesn't incorporate unwanted facilities. That sounds very logical, but wrong at present.

The new Datanen won't let you draw marvellous pictures instantly or play games. Of course, it wasn't designed to do those things But it still costs £25. Ah. perhaps it's more stable than the rest? Wrong again.

But that needs qualifying, so read on. Datapen sent us both Vic and stylish it is too. It looks rather like a surgical implement - the others just look like pens.

We tried the Vic's pen, which comes with a tiny introductory manual and a cassette tape full of introductory programs. The pen has a built-in switch and a LED lamp which lights up when the pen's pointing at the screen. (What value that has escaped us.)

The manual doesn't tell you a great deal, and what it does say is repeated for other home computers. So there's not as much information as you thought. Was it too much trouble to produce a dedicated manual? It does cover the basics, though: a little program that demonstrates the switch, another

one that reads x/v coordinates, a tiny section on stability of position and higher resolution Those last bits will probable baffle most people and the rest isn't particularly useful by itself. For £25, you'd expect a great deal more in the way of explana-

Simple symbols

But the pen can be useful for the less experienced via the accompanying tape. The first program, Symbol Draw, lets you use all the symbols and characters the Vic can produce But at best, you can draw only

The next program, Medium Resolution Draw, supposedly lets you draw freehand in blocks a quarter the size of a low-res graphics block But it doesn't work very well at all.

The erase facility works just as badly. You draw the same block with Erase mode on - which sounds simple, but the block won't disappear unless you're exactly on target. Since the pen leaves no image on the screen. there's no way of telling exactly where you are - most frustrating One function that does work well is saving and loading from tape, if that's any consolation ... and it probably won't be. Generally, the Datapen was

pens. To improve stability Datapen supplies a tiny rubber ring that can be inserted into the tip of the pen. But that cuts down the amount of light entering it; so you need to turn the TV's brightness up - very unpleasar for the eyes

In fact, the pen labelled for the 64 seemed to work better than the Vic's pen - they look identical anyway. Datapen's Commodore 64 version is a slight improvement (perhaps dear old Vic doesn't get along with lightpens). At the time of writing, the supplier hadn't yet got down to producing the equivalent of the Vic version's introductory programs: but it did come with what amounts to a manual on tape. That's a nice idea and it works pretty well.

The on-screen information itself helps you get to grins with reading x'y coordinates

demonstration of sprite movement and an indication of which part of the program it's located. So you can list the whole program and work out exactly what's going on. But that's as far as it goes The 64's version You're directed to the 64's manual for more info on spri

in particular. Again, for the price, you'd expect Datapen to provide much more in the way of sound practical guidance.

When you've mastered that,

you're given a little

Conclusions

To sum up, if you're buying a pen for programming purposes you're going to be left pretty much to your own devices (as it were). Neither the Stack or the Datapen will give more than basic help - but perhaps that's all you need?

For the drawing enthusiast, the Dams pen provides scope (albeit limited) for creativity Games players? Well. Stack's offerings started out on a low key but they're getting better and

should improve in future. Lightpens are still rather expensive and still don't really merit the price tag. Manufacturers make

pronouncements about continued improvements, mor advanced technology etc. but lightpens are still limited by their frustrating and sporadic 'shakes'. As data input or pointing devices, they work very well. But for more sophisticated applications, they're all still rather limited

A great new guide

FORTH FOR MICROS

Steve Oakey

FORTH is rapidly catching on with micro users – its easy to use and much faster than BASIC. This book, the only one devoted to FORTH for microcomputers, the only one devoted to program in FORTH and demonstrates the use and power of this extensible language. It covers the different versions of the language, includes exercises and answers and has numerous program extracts.

Softcover 160 pages £6.50

Also available

BASIC for Micros £6.50 Pascal for Micros £6.50

COBOL for Micros £7.95
FORTRAN for Micros £5.95

The Fretful Pet

One man's journey towards computing

by Bohdan Buciak

Fred Reid used to put up with doing menial jobs like labouring, working in warehouses, on the factory-floor. But he's put all that behind him, and that's probably not as easy as it sounds. Now, he's made the break; he's working for himself, making and repairing guitars. He could call himself a craftsman – but he's too unassuming for that.

Fred's other joy along with doing things with guitars is playing around with computers. So it's not surprising that he should try and put an ageing Commodore Pet 3006 to good use in the fledgling and rather precarious one-man business he's running.

Playing with guitars

"Ever since I was sixteen I'd wanted to be independent of others but I've still got a long history of doing boring jobs for other people" – jobs like lumping gear around for a small-time rock

Still, working for the band inspires the youthful Fred Reid to buy a cheap guitar and become one of the millions of amateur strummers trying to play Stairway to Heaven

Cutting a short story even shorter - Fred isn't satisfied with his cheap guisar; he fiddles around with it and tries to improve the way it plays. And he starts repairing other people's guisars, acoustics and electrics, with the smattering of experience he's caimed.

"I had a few basic tools and a little knowledge of electronics because that was my hobby. So I also started building and selling pre-amps for synthesisers to West End shops, toothing them around and trying to get repair work." Pretry soul-destroying stuff for the youthful Fred, but he has a part-time labouring job as well to keep the rent-man from the door. It might be persistence or.

It might be persistence or.

It mayn be persistence or the besting in the right place at the death of the the rest Pred this Luckly Resek. "I was doing one of my weekly trips down the Charting Cross Boad; presty futilises because I didn't have much experience to talk of." But he milligets a job offer from one of the musical instrument shops (with Repairs in the basement). "They were impressed with only a tool kit with the So I gut the job, like an apprecticably really."

Not quite rags to riches yet, though. "Six months later we parted company. Nothing nasty. just seeing too much of each other. But I'd picked up enough skills, and doing the job filled up a lot of gaps in my knowledge."

Going it alone

Armed now with more and better skills, Fred tries to go out on his own. I spent two years trying to amase enough wealth to buy the anase senough wealth to buy the necessary tools and equipment. He would from home in his business (officially, anyway) on council properly. He's not getting enough customers to make it all worthwhile either. So clouds darken his vision of ... Thad a lot of bad buck trying to ... Thad so to fo bad buck trying to ... Thad so to fo bad buck trying to ...

find premises; it was either too late. sexpensive or I got there too late. But eventually a shiny if not exactly silver-lined cloud drifts along. "Finding the place I'm in now was a stroke of luck; it's cheap and there's a few other musical instrument repairers around, like a community really it's very pleasant here."

"Here" is a converted Victorian hospital on the edge of London's decaying East End (or on the edge of London's exciting high-powered Cify area, depending on which page your A-Z falls open at yhere the mosans and groans of past patients are being

replaced by more tuneful sounds and a lot of small husi (We've in hore too)

Getting a Pet

With his new home comes a less than new computer, a Pet 3000. "A customer brought it in wanting me to write a program to run a polyphonic synthesiser. The arrangement was that I do the work and keep the Pet as partpayment". A daunting task, surely, for comeone who'd never used a a nice challenge for me, but it's taking a long time."

Like the bloke in the Talents parable. Fred starts thinking up useful things to do with the machine. Does he play games on it or does he put it to good use? He comes up with an idea (secondhand because another guitar-maker thought of it first) to write a program that calculates the distance between a quitar's frets. But would that really be useful or was it just another chal-

"My problem's always been that I do my calculations (there's a standard formula) on paper which gets lost and destroyed. The job usually takes about half an hour and involves a little bit of messwork. You only find out whether you've got it right when the whole quitar's finished. It's too late if the thing won't tune - and you've lost credibility with the customer." Pretty disconcerting for a budding rock-star with his sights glued on platinum discs and NME with a bullet.

Fred spends a lot of time in his murky workshop just defining the problem in a way that could be handled by a computer. He's got a friend who works with computers to help him out. So eventually he emerges with a simple program; you key in the scale-length (distance from bridge to neck) and the number of frets you want. Press a button: and hey presto, the figures come up, accurate to eight decimal places

That's got to be accurate enough? Well, not for Fred.

Fretful problems

The trouble was that it calculated

the theoretical lengths. You increase the pitch of a string when you press it down, so the height of the string above the fret becomes important too, and the

slight differences between electric and accoustic quitars with electrics you can sometimes vary the scale-length by adjusting the bridge horizontally.

Faced with these mamoth problems. Fred starts putting more variables into the program. Like the size of an average finger, the optimum action height for both acoustics and electrics, the guage of the string to be used, the tension (a factor of 1 to 5) on the neck. It's not really an obsessive quest for perfection though, more of an insurance policy against wasted time, money and reputa-

By Christmas 1983 Fred has made four guitars using the program; the first attempt didn't quite work out but that was before he'd thrown in those new variables. Is he now satisfied with the revised version? "The program works very well now and it's just about as accurate as I'd possibly want.

But I still haven't come up with a reliable formula for classical mitars. There's such a lot of different string weights and tensions that you've got to rely a lot on intuition." And that's probably how it's going to stay.

Financial grappling

Being the resourceful person he is. Fred won't let the matter rest with computerised fret calculating. He has surprised

a program that works, and one that also looks to be pretty useful. With his new-found confidence he prepares to grapple with his

"I decided to produce a list of all my customers - names. addresses, phone numbers details of instruments. All the information I usually lose when it's written on scraps of paper." He goes about doing this in the same pedestrian way; starting with somebody else's program, a simple records file, and then nulling it to bits to see how it

works and how to expand on it. "It took me quite a while to work out how to present the information." Now that he's done it. he goes on to scale even greater heights: to produce an accounting package, specially designed of course, for his

particular needs Twe worked out a program that tells me in what state my monthly finances are: who's paid me, who hasn't, what I'm still owed and, hopefully, when I'm going to get the money." He regards this last point as a life-line; getting paid is often complicated by people making a down payment (what he calls "putting money up front") with the rest due on completion of

And he goes from programming strength to strength: he works out a basic stock-control system and a nackage that lets him keep track draws nice little graphs - could be on the very edge of financial forecasting? Fred reckons it should impress his bank manager anyway

In developing all these programs, he's probably gone through the same learning curve and development stages as the professional programmers. Trouble is, he could have bought the software and a Vic or Commodore 64 to run it - but he didn't have the money.

Disadvantages

That's where the disadvantages start creeping in. Fred uses the standard Commodore cassette machine for storing programs so he wastes a great deal of time just loading files. As yet, a disk drive is an unaffordable luxury, but he knows he'll need one to integrate the financial programs he's already got

He wants a printer too; not only to get hard cobies of his finances the moment he just takes 35mm photographs of the screen!) but also to print out his graphs perhaps a little word processing He's already thinking of devising

a logo to impress customers. Then there's the inherent deficiencies of the Pet, its lim memory, its tiny 40-column screen. Fred's pretty pragmatic about such things - he'll carry on using it in the absence of anything better because it's there, and he's

grateful just for that. Fred is really pleased (not selfcongratulatory) about the system he's developed - and rightly so. "If I hadn't taken this step towards computerisation, my business would be in a real mess right now. I'm planning ahead more and keeping in touch with the state of the business. It's a matter of confidence really - confidence that things aren't as bad as they

But he's also managed to combine business with pleasure. Not just the pleasur of doing what he enjoys with no Boss breathing down his neck, but the satisfaction of being in the know about computers. "It's giving me a lot of fun and it's an exercise for the brain" - not that his brain needs organising, it looks in pretty good shape.

Letter

Americ

Here is a random collection of interesting facts about your Vic-20 and its operation.

If you make your first program line a REM followed by a shifted "L", your program will not LIST. Instead when you LIST, you will nee only a SYNTAX ERROR.

POKE22,35 will keep your program line numbers from printing in a LISTing. This POKE may be used in conjunction with the CMD command to give you a tiny word processor.

Pressing the plus, minus and pound key all at once will home the cursor.

LOAD"\$\$",8 will return the disk header, and the number of blocks free, but no contents. LOAD"\$"-PRG".8 will show

cely the PRG files on the disk.

LOAD'S*-SEQ'\$ will show
only the SEQ files on the disk.

Using the memory-read and
memory-write disk commands is
similar to PEEKing and POKEing
the Vic memory, but directs the
commands into DOS and DOS

RAM. VIC-1540/41 drives contain about 2K of RAM.

Lo-res graphics are those pictures drawn using only the characters available from the Reviboard with none specially

keyboard, with none specially defined. The CMD command contains a carriage return. If you wish to

keep it from happening, send "CMD,". SYSPEEK (68532)+256*PEEK (68533) will reset any Com-

modore computer, and is a universal reset call. POKE212,0 will cancel the quotes mode. POKE212,1 will aum it on

Location 653 contains the three flags, SHIPT, COMMODEE, and CONTROL. If bit 1 is set, the SHIPT key is pressed; if bit 2, it is the COMMODEE key, and bit 4 reveals the CONTROL key. How do you see which bit is set? Use the boolean operand "AND" to compare bits, as illustrated in this short program:

100 IF PEEK(683) AND 1 THEN PRINT "SHIFT": GOTO100 200 IF PEEK(683) AND 2 THEN PRINT "COMMODORE":

300 IF PEEK(663) AND 4 THEN PRINT "CONTROL":

GOTO100 0 PRINT ": GOTO100 The ANDing technique above could be a key to your understanding how one byte (eight

bits) can contain more than one piece of usable information. If your disk gets stuck in the ?DEVICE NOT PRESENT rut, initialize it with: OPENI,8,15,"T:

A reader reports an increased 1541 reliability by raising the drive above the table with taller feet, and installation of a small fan at the top-rear of the drive to draw air up through the drive. A disk can be formatted without changing the ID, by leaving it will only work if the disk has been previously formatted, and an ID exists.

Do not use GO as a variable —

to honour the spaced-out GO TO, Commodore included GO In the keyword table. If G occurs within a variable line followed by the boolean operator OR, make sure a space is placed between the G and the OR.

Confused about whether you have the right number of open and close parenthesis in a Basic line? Remember that you should have the same number of CLOSES as you have OPENS.

Transactor (the US newsletter) reports that a program listed to the 1525 printer immediately following a SAVE will drop characters. A suggested fix is to type VERIFY (RETURN) RUN/STOP.

The 64 VIC chip has no interlace mode: the Vic-30 does.
If a program is halted with RUN-STOP, entering CONT will resume the program ines have been added, deleted, or edited. CONT-insuig will cause the CONT-insuig will cause the pressed, and some screen clutter may be generated in the CONTinsuiton. It will be quickly noticed in LOADs from within noticed in LOADs from within

Disk drive making funny noises? It is possibly to place some disks into the drive with the disk slightly off center. This is especially noticeable on disks without hub rings. Make a small attempt not to get carried away with the assumption all is well when you throw your next disk into the drive. Programs can be easily loaded programs can be easily loaded.

from the disk directory, by placing the curror at the first position on the line containing the desired program, typing LoAD (over the number of blocks contained), then cursor past the closing quote, where &: is added. The screen will over-print and look quite messy, but the LOAD will work, and the program will LIST and RUM.

With most printers top-of-form djustments should be made vior to power-up, as it is the mitialization of power that sets he printer. I would like to report a reduc-

replacing my 6822 VIAs with 6822As. Inside the Vic, the 1MHz 6822 is clocked at 14.318 MHz/14 (or roughly 1.023 MHz) — leaving no margin. The 6822A is a 2 MHz version of the same chip.

If you would like a blank line a rwo to separate sections of a trogram, enter your desired line number followed by a colon, the me will stay, but will not give SYNTAX ERROR when RUN. It is similar in this application to the REM statement.

SPECIAL PROMOTION

Our regular round-up of games reviews

We get to see a lot of games here at Commodore User, so many in fact that we can't handle all the reviewing ourselves - we farm out some of them, which is why our reviews have someone's initials at the end of them. We look at everything we get, but we don't necessarily print all the reviews we write: instead. we tend to stick with (a) all the best games we come across and (b) those games that you're most likely to find in the shops or the mail order ads.

ATOM SMASHER Vic-20 (Unexpanded) Price £6.99

Super ZAP!!! Eat your heart out, Greenpeace'(?) and stop the into meltdown. What a

ROMIK SOFTWARE ATOM SMASHER

WILL YOU BE THE SUPREME WORLD CHAMPION?

The scenario goes guite a bit haywire after this; you do not liquid sodium coolant, but instead within the nucleus whilst dodging the electrons - and all this before core! Your high-tech 'Waldo' can molten mass: but this is no long term solution, you must keep Loads in two parts. I consider

the use of the space bar to move through instruction pages is a mistake; it is too easy to flip over more than one page. The game however is brilliant! While the the sonics are great - they really

It is quite a hard game to play; level one is all right for a

beginner, but at the higher levels it really gets hot. So does any game: but this one is a must! IDC

PEDES AND MIITANTS Vic-20 (Unexpanded) Keyboard only Price £6.99

your ship is at the top of the screen and the Aliens and such scroll up towards you. Get the idea? Well, you ain't seen nothin' yet! The speed of attack is incredibly hectic and it's extremely hard to clear your path of Pedes and Mutants and score high points.

ROMIK SOFTWARE AT PENES & MUTANTS

WILL YOU BE THE SUPREME

It is almost as hard to read the instructions on the screen as the colour contrast is rotten. This might not seem important as the instructions are also on the cassette cover, but I have a thing about unclear screens.

Anyway, loads of ways to score points - both by hitting targets of various Mutant kinds debris. Very complicated, needs lots of practice. The game loads in two parts. The game itself is wildly dramatic, with a cunning intermission that mind-blows you into having another go. The onics are quite good; and the

graphics are very clever, though a bit murky in places.

Definitely one to watch out for, but I have two criticisms: the laser bolt and my ship seemed to get separated if I move too quickly - making a very odd scene as ship and laser moved about the screen with lives of their own And at the start of the came it is almost too fast to play unless you are really good. For these reasons I would not buy it without a demonstration. IDC Domile Software

The Forth Page

The complete Forth review?

by Richard G Hunt

This is the third in a series of four articles which look at the programming language Forth, and in particular at its implementations on the Vic-20. This one reviews a book which every student of Forth whether novice or old hand will at one time refer to

Any subject no matter how esoteric will produce a standard text book. Forth is no exception. And the book that most people will consider as the book on Forth is Leo Brodie's Starting Forth; undoubtedly it is a valuable contribution to a general understanding of the language.

An alternative must be Alan Winfield's The Complete Forth (published by Sigma Technical Press at £6.95). It is cheaper, slimmer and British (the author being a lecturer in the Department of Electronic Engineering at Hull University).

Forth is essentially a portable language. In other words source code written in Forth will compile and run on any computer system that supports Forth. At least, that's the theory: obviously any code in any language that makes use of the operating system or the special characteristics of a given computer will not be nortable without some effort

With Forth, though, it doesn't matter so much because if the programmer has knowledge of the purpose of the code he or she is able to define a Forth word that serves that purpose. This is the essence of extensibility and is what can make Forth a specialist's language. I like to think of it sometimes as a DIY language!

Be that as it may, a Forth implementation starts out with certain well-defined characteristics. Other than extensibility, these are use of the stack associated with Reverse Polish Notation (RPN): and a dictionary of 150 to 200 words which form the elementary building blocks of higher-level programs (known in Forth as 'words'). Understanding of these characteristics is the stepping-stone to thinking and writing lucid Forth.

Coming Forth

Alan Winfield's book is subtitled "a new way to program microcomputers" and anyone new to Forth is recommended to take this as a literal statement. Most newcomers to Forth will arrive by way of another high-level language, probably Basic. Forth requires you to have only some idea of the function of a computer and not how that function is realised: put aside Basic statements and step into a looking-glass world where normalcy seems topsy-turvy (or at least backwards-looking) this peculiar effect is a result of RPN and the stack

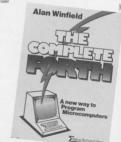

Actually using a stack for all intermediate numeric results demands RPN. Also it is faster in operation: the familiar algebraic ordering system requires interpretation as well. The content of The Complete Forth is designed to introduce the beginner in easy stages to RPN and stack manipulation, leading early to examples of Forth words

Naturally these are stack manipulating words that enhance 32. Forth's arithmetical capability. Indeed I became very much bogged down in Chapter 1 trying to define some stack manipulating words like ((pick) and (roll)) which were not implemented on my system.

Gradually more complex ideas are examined and a Forth system and dictionary described. From word definition to Forth structures (conditionals and loops), examples accompany description. Reliance is made on Forth being an interactive language. You don't need to, but it can help if you sit down and enter the words and problems into your own machine.

It is distinctly possible that the maker's handbook is less than explicit, and expert advice can be needed. Winfield comes to the rescue with the chapter on Editing, Saving and Loading. A Forth editor is perhaps the most non-standard part of the system. Both Forth implementations I have used on my Vic have different editors; one makes use of natural features (if that is the term) built into the Vic (and other CBM machines) plus some clever use of RAM in lieu of disk.

The other follows more nearly recognisable Forth standards. and I discovered it was fully described in this chapter. Unfortunately as I may have intimated in my earlier review of that cartridge it did not make that particular editor any easier

Advanced Forth

The final chapters dwell on more advanced matters: double precision numbers, extending both the dictionary and the Forth compiling capability. As a finale the author provides the listings of two Forth programs which I recommend should be entered whether they are your type of program or not. What can be learned from someone else's code cannot be written down easily.

There are indeed many areas in this book which deserve detailed study and exercise at the keyboard. To the example of extending stack manipulating words I should add extending double precision words. It is eminently satisfying to define a word intellectually and then see that it actually performs as expected (or as hoped!). The book provides the stimulus as well as the material on which to build.

Alas I cannot take credit for all such definitions which I have added to my Forth Definitions. Winfield is kind enough to provide definitions of several of the more useful words. proving beyond doubt that it does not matter which or whose Forth you have - only extend it as you will. Winfield writes to the 79-standard providing footnotes on some of the departures most likely to be seen.

Winfield in his preface states: 'Most of the existing languages suffer serious limitations; Basic is too slow for many applications; yet assembler is not user-friendly, is difficult to learn, and worse still, is limited to one processor. Forth overcomes all of these difficulties to provide a compact and friendly language, with fast execution.

GAMES

True. The Complete Forth too is compact and friendly. It is also a realtime tool for solving realtime problems - whether such problems are serious or less so again does not matter. Forth words that 'work' do so because they have been correctly compiled. That cannot necessarily be said of Basic

Winfield's book is indeed a new way of looking at programming. It is readable and divided into manageable portions. It teaches, re-inforces and inspires deeper delving. It bears re-reading until the lessons have rooted. Then you are on your own - Forth is bounded only by the memory available to your machine. At £6.95 'The Complete Forth' is a worthwhile investment.

Review Go with Gortek

An easy way into Basic on the Vic

by Bohdan Buciak

Teaching young people Basic programming can be difficult if those same children have been using their home computers exclusively for playing games. So three English schoolteachers have devised Gortek and the Microchips, a set of programs that try to combine learning with game-play.

Commodore now markets it as a package containing two cassettes and a Training Manual. It costs £12.99 and looks pretty glossy and attractive. But is it informative? And how much real fun are Gortek and his Microchip friends?

First let us introduce Gortek. that staunch robot-like figure with the large worried eyes. Why worried? Because his planet, Syntax, is under threat of invasion from the nasty Zitrons. If they succeed, they'll destroy the all-powerful computer, Creativity, which Gortek guards along with his band of Microchips. You must learn to program along with the Microchips to repel the Zitrons and preserve Creativity. Sounds like being fun? Definitely, so load up the first

A rather simple game called The Zitrons are attacking with that devious weapon, alien letters. As they fall, you must press the corresponding letters on the keyboard to destroy them. So zapping can be educational; a few minutes of that and you've miraculously learned a little about keyboard layout. Not much in the way of graphics, though And that regrettably goes for all The next game counters

another dastardly Zitron ploy. This time they're duplicating passwords to try and land. Trouble is, they can't spell so you tap the incorrect words to keep them out. Ah, so correct syntax is essential in programming? Maybe that point was too subtle it's never really articulated.

Manual Jahour

Having done a little game playing, you're brought back to the appropriate page in the manual. After a little work, you're told to take a break and load up another game. This is the general pattern; you alternate between screen and book so the learning part never gets too strenuous. But what have you learnt by the end

Well, you've become more familiar with the keyboard. One of the games, Flog, has demonstrated the computer's ability to add and subtract. You've written a little program and learned some basic commands which the Manual very sensibly lists as a recap.

A few symbols for PRINT statements have also appeared which proved slightly more tricky; you're suposed to find out for yourself what the symbols do. There are answers in the back, but one gripe is that the 'heart' symbol isn't explained. So you've learned some of the basic stuff. and there's more to come.

But back to the Zitrons: they're now preparing to land on Syntax to sabotage Creativity, so training up with these exhortations regularly but it does warn you against jumping ahead too quickly. That's wise because it's all getting more complicated.

Boxes of Variables

You've now reached the second tape and about a third the way into the Training Manual. The first program on the tape is called Boxes which corresp with the page on variables. The

does impart the idea that a computer stores information whether numbers or letters, in a 'box' labelled with a letter. It explains the dollar sign too as the indicator for alphanumeric test your comprehension.

Having grasped that, you key in a program using string variables from the manual. Again the book dispenses with the technical terms probably because they may confuse the tender of age. What's probably how to correct lines when you get a syntax error on running the program. The Training Manual surprisingly neglects to explain this point, so you'll need to browse through your User Manual, earning you extra points

Despite that, the book is generally very good. It's colourful, well-illustrated and uses bold print. The program listings are clear and easy to follow. The course has been designed so that more use is made of the manual as you progress, and it's never patronising either.

Back to the great task, though. The manual now looks at multiplication and gives examples of programs that print out multiplication tables. But if that's too academic for you, a flip over the page takes you to the computer art section. There's a program for this on the tape which sounds good but, in fact, it is quite boring when you run it. Since the manual gives listings of alternative designs, you'll probably be inspired to create

something more imaginative. But what's Gortek been doing all this time? You've probably guessed that the Zitrons aren't about design is part of his counterplot. The next step is

programming Creativity (the computer, if you'd forgothen) to be friendly. That sounds reasonable too, because "a smile enerates a smile" chortles the manual in its usual happy tone. That should confuse the Zitrons. Meanwhile, you run the Conversations program and have a nice chat with the computer.

Playing with Zitrons

That theme is expanded in the manual, which lists an example of an interactive arithmetic program for you to play around with. This is where the division sign is introduced. But we're almost near the end and the Zitrons have

landed, only to be mesmerised by the next program you've just loaded. Of course, the object is that you help the Zitrons play – to make them forget their destructive instincts.

But that's not enough; you've got to write new programs to keep them occupied. So the last two pages are designed to test the programming knowledge you've gained. Whether you profited from the experience or not, it all ends happily. You've convinced the missanthropic Zirons that "there is something better in life than destruction" and that "comprising is furi. Could that be a side-writpe at space-travalet anapping?

Conclusion

Young people reaching the end of this course will, no doubt, gain a sense of achievement even if they're already beginning to forget what was initially learned. That doesn't matter because they can do it all again, or any of it's

large variety of parts. This is a clever package, partly because it encourages children to find things out for themselves. Being based around a story, it holds interest far better than most educational programs. It's a good story too, and only the first in a series – Gortek and the Kryptobytes is coming soon.

Vic Scrolling

by Barry O'Rourke Irich Amateur Computer Club

Scrolling on the Vic is normally available only in one direction - up. The text on the screen moves up if you print anything on the last line.

The short Basic program below printed on the second line of the screen and line 10000 is called. the whole screen (with the exception of most of the first line) is scrolled down one line.

- AS = "" FOR T = 0 TO 18: AS + AS + CHRS (29):
- AS = CHRS (19)+AS + CHRS (160) + CHRS (157) + CHRS (157)
- AS = AS + CHRS (157) + CHRS (157) + CHRS (148) + CHRS (148) + CHRS (148) 1000 REM SCROLL DOWN 1010 PRINT AS:POKE 217, 158: POKE 218, 158

GOTO variable

by Barry O'Rourke Irish Amateur Computer Club

As a GOTO must be followed by a number on the Vic or 64 going to a particular line with a statement like "GOTO X+24*2" was impossible. Until now, that is.

The program below provides a full GOTO X command. It uses the form SYS location, formula where 'location' is the address in memory of the routine and the value of 'formula' is the required line number. Of course you must check that the line number does exist, otherwise you'll get an UNDEFINED STATEMENT ERROR.

FOR T=0 TO 11: READ A: POKE 736 + T,A: NEXT DATA 32, 253, 206, 32, 158, 205, 32, 247, 215, 76 **DATA 163, 200.**

Then you can use SYS 736, line number.

Subroutine printer

by Lenton Goforth

We spotted this useful-looking routine from Californian Lenton Goforth in an issue of the Commodore USA house magazine Power:Play. It's reprinted with thanks to author and editor

In the process of writing a very long program, I needed a way to list the separate subroutines on the printer. Luckily, I had room for a routine to do this. Here's how it works.

When run, the program asks for three inputs from the user: title of routine, starting line number and ending line number. The listing of this routine is a sample output. Notice that the line numbers are included in the title.

First leave room somewhere for the routine in your program. I chose to put it at the very beginnthe program to run, then I type

Then answer the prompts. When the screen clears and the printer stops, hit RETURN. When the printer stops again, hit RETURN

DEALS READERS FOR

Welcome to DEALS FOR READERS, a collection of Special Offers from Commodore User magazine This Catalogue offers you excellent deals on Vic and 64 products. Some of them, the the distrovers and the Victoria

£17.95

€4.20

tapes, we have produced ourselves. The others are things that we regard as Good Ideas and Good Value, mostly items we reviewed in Commodore User before we decided to sell them. On most of those we have fixed up discounts for readers (while we aren't allowed to sell books at a cut price, we can include P&P in our price)

If you want to take up any of the offers, just use the Order Form on the back page. And take a look through the Catalogue; even if you don't want to buy now, we'd

like to know what you might be interested in seeing in future

Vic Key Programmer

We've had a number of requests

for a program or routine that allows you to allocate text strings to particular function keys. Well. Ionathon Reynolds has obliged

with this handy little number for a Vic with any expansion.

When you RUN it, the machine code is loaded into a chunk of memory at the top of Basic, SYS

7380 lets you define the function keys one by one, using the key

number followed without a space by the text you want to appear when that key is subsequently pressed. You can assign up to ten

characters to each of the eight

function keys - enter any more and the Vic will ignore the remainder. (You can't try for four more func-

tion keys by using the CBM key as

Very useful for common Rasic keywords, of course, and easy

enough to incorporate into a pro-

a second shift.) Thereafter you SYS 7480 - and voila! Pressing a function key puts your assigned text on to the screen.

gram as a routine

THE BIG ONE

Win £1,000 worth of extras for your Vic or 64!

The main prize:

A patter with paper and gase "ribbors". — this drive with ten dishe for it — a word processing package — A database package — a spreadfacher calculator package, a databover for the computer — a lightpers — a piperdic. — the Programmer's Reference coloridate programmer, the best of the same' looks that have been published independently — a whole collection of games on cutriday and tapes — programmer's side to simplify programming color and graphics ordines — the balant cantattes — a Commodor Universe results—and more!

For the runners up:

- Five Second Prizes of a free subscription, a Commodore User tee-shirt, and a Commodore User binder for your magazines
- Ten Third prizes of Commodore User sweatshirts
 35 Fourth prizes of Commodore User tee-shirts

How to enter:

The \$1,000 Competition runs in three parts, and you'll need correct answers to all three to stand a chance. You will also need the cut-off coupon from the bottom of the Competition Page. all the entries MUST be accompanied by the coupons and the Entry Form that we'll have on the third and last Competition Page in April. So

Part Two appears below. Put your answers on a separate sheet of paper, cut out the coupon, and keep the two items somewhere safe. Part One was in the February issue: Part Three and the Entry Form appear in April.

PART TWO: THE £1,000 CREATIONS

This section of the Competition is really easy. All you have to do is describe TEREE game scenarios – in other words, come up with three interesting games for the Vic or 64 and describe what would (or could) happen.

You should always specify the hardware that would be needed - Vic or 64, joysticks, whatever. But keep it reasonable, the winning entries will be games that could be programmed and could be used by most read

Each entry will be rated by us on the following criteria:

- A how original is the idea?

 B how interesting would the game be?
 C is enough detail included in the descrip-
- tion?

 D how feasible would it be to program?
- Note that we don't want you to write the programs, just to describe the games. But you will have to be aware of some of the technical constraints like will your scenario fit into mem-

Beekeeper

hu R M Phillips

One for the sweet tooth - in this Vic same for keyboard or joystick you're the eponymous beekeeper with a garden all to yourself. Your job is to collect honey from the beehives and fill your honeypot.

Problem is the bees. They aren't standing (flying?) still for the blatant theft of their hard work; and they have stingers ...

Evade the bees, fill the honeypot and you can go on to the next skill

NEW GAMES WANTED!

And if YOU'RE game, this could be just the opportunity you've been looking for!

Follow the success of our initial launch into the computer software market with the K-tel DOUBLESIDER range, we're now looking for exciting new games to continue the series. And this is where you come in.

If you've got a great games program for either the Commodore 64, Vic 20 or Sinciair Spectrum, let's hear all about it. What we want is high quality, nifty graphics, original ideas and good, old fashioned fun.

So you think that your game might fit the bill? Then send a cassette copy with details to Mike Dixon, K-tel International, 620 Western Avenue, London W3 OTU straightaway. Or telephone him on 01 992 8055.

(OK-tel

And remember programmers . . . use your computer for fun. And profit.

The 64 ought to be an excellent computer for games – and fortunately some suppliers are indeed taking advantage of that. Others aren't Here's this month's crop of reviews.

How do we assess games? Basically we play them – which may sound obvious, except that all the reviewers have seen so many games that they can apply a bit of comparative experience to the evaluation.

nave seen so many gainfatt and the second of four criteria. Presentation means how well the thing is packaged and We and gluode on the screen child graphics and poor sound get marked down here. Skill level refers to how much skill (of whatever kind) is required to play the game – so if pure chance is involved, the game gets a low mark, But don't dismiss it on that some (chance) games are great fun, laterest is an answer to how well the game did at maintaining the reviewer's interest in it. And Value for Money is obvious enough: it's our overall conclusion about how it compares with other games and whether we'd buy it ourselves.

COSMIC SPLIT Joystick only Price 67.95

An astronomical title for an honest, down to earth game of Centipede. Two unusual features are the rotating segments of your creepy crawly antagonist and a whirling fireball, both well animated. Snakes, spiders and fleas complete the menagerie your laser cannon has to destroy, amidst the green and pink fungt.

A faithful, competent rendering of a popular scenarior colourful, with all the action applicable to the plot. The grey background is a happy choice, being both restful to the eye and setting of the characters well. Smooth graphics with unperparent setting of the characters well. Smooth graphics with unperparent setting of the characters well. DEPTH CHARGE

keyboard Price £4.99

In this caseeth-based game by Commoders you are the Commoders you are the Commoders of a battleship which can be moved left or right across the top of the screen (the ocean surface). Enemy submarines move at different levels beneath the cosan, releasing deadly mines (7) which float to the surface to destroy your ship. These must be avoided by rapid evolutions or by dropping depth charges to destroy them.

Up to five depth charges can descend at any time, and you score points by destroying mines or submarines. The main object however is to survive for a period of 90 seconds: points are scored for every second you sur-

This game is not easy, after an hour of playing on the lowest level, instances of surviving the full period of time were very rare. But it didn't hold our interest for long; graphics are mediocre for the 64 and the poor use of colour made if difficult to distinguish between depth.

charges and mines. (We suspect that, as for the Vic, Commodore's quality games are on cartridge – where at under £10 each they represent very good value for money.)

Val

This latest masterpiece from the Liamasoft stable brings you not only arcade speed and action, but also graphics, animation and sound which demonstrate the magnificent potential of the CBM 64.

Using the joystick you steer Got

An Rennet and his horrowed airno lawnmower to mow your way through the garden, avoiding the neighbour who is trying to retrieve t. You must also avoid the flower heds or the infuriated gardener will start chasing you. Your dog is initially a help and by using the ovstick button, you can command him to fend off neighbours or gar deners. This is particularly useful if forced to remain stationary until it cools down. Alas, using this facility soon exhausts the dog's obedience and eventually he gets fed up with the noise and your four learned friend becomes a hazard by attacking the mower. Guages are prorided for mower temperature, dog tolerance and dog obedience and 16 different gardens are programned in, the first eight being pre-

selectable. This game is highly recom nended - it will undoubtedly be come a classic. WG/PR

SKI-ER 64 Joystick or keyboard Drice EE 00

This is one of those beat-the-clock games that gets everybody pushing in for their turn. It works just like real slalom skiing; you manipulate your skier around the gates, trying to clock up the fastest time. Hitting a gate gets you disqualified immediately. But you can get away with knocking a post. You stop the clock by shooting through the finish line and then it's Franz Klammer's

The blurb tells you there are two games: Slalom (with two

decrees of difficulty) and Alps. But Alps merely replaces gates with trees, so why bother? At least the trees really look like

Both games use speed-up and slow-down keys, and you'll need them too as the speed gradually increases as you hurtle along the keyboard seemed better than joystick for control. Most of the ecreen is white (not summissing really) so you may need goggles to avoid snow blindness. It's

WIDOWS REVENGE Iovstick only Price £6.99

Gather your strength while it's loading! Son of Centipede maybe: but it's a whole new ball game Mushrooms are replaced in favour of blue eggs and dreaded white energy pods: no worm - but hoards of black spiders marching towards your DDT spray. If they bump into a blue egg they merely change course but an energy pod causes a deadly thread to be cast downscreen. The black widow tracks across the combat zone depositing energy node but the real stay is the bat-like creature, laving blue eggs willy nilly - you can't obliterate him merely scuttle him off for a second or so. (He also demonstrates sprite graphics rather well.)

You can leave the screen light crey or allow it to change colour after each wave. One or two player option, with more than enough to shoot at even for adept arcadians. These features added to good graphics and sonics make this a good bet for all 64 owners. Will we get a sequel? Rubble Rus

Paperclip 64

GO DE STATE OF STATE

Paperclip 64

This is a disk based program used in conjunction with a security 'key' (or dongle') which fits into one of the control ports. The program allows 829 lines of ext, equivalent to just over seven pages of A4- more than adequate since files can be linked together giving virtually unlimited length.

Functions

Paperclip is absolutely loaded with functions and it would take a magazine of its own to go into them in any detail – the manual is a massive 112 pages.

The program does not format as jost type and therefore a large share of print format commands are to appear in the document. The maximum width that the document can be set to is 180 columns, but typing in on 40 columns with varpround makes it impossible to see how the document will look on the column that the column that is a large to the column that is a large to the column that is a large to the column that is period the 40th column.

The format commands are easy mough to use. They are preceded by the 'check mark' generated by hitting the £ key. Examples are all which turns centering on (cn0 urns if off again); pgN sets paging ther N lines; jul turns on right-

These commands must be on a sew line and must not be followed by text on the same line. As with all NP programs that format only on pinting this has the effect of braking up the document and saking it look very cluttered.

Some of the embedded format some of the embedded format mmands can appear within the ext; these must be preceded by the ESC (left arrow) key and pertom things like underlining (ESC 6) and italics (ESC 6).

Actually editing the document actually editing the normal editing functions are swallablands and that allow lines of text to be moved, copied, deleted or saved. Although these work only on whole lines there are additional 'phrase' editing commands to amend part lines as well.

A very nice feature is the use of the Commodore key to toggle insert mode on and off. This allows text to be inserted anywhere in a document in any quantity.

Tabs are set using the Shift CLR key; the tab position is shown on the second line of the screen. (The top two lines are the Status line and the Tab line respectively.) The Tab is then selected by using the RUN. STOP key. There are also numeric tabs for lining up columns of figures, set by CTRL N.

One drawback of using numeric tabe is that they do not recognise the fact that you can precede a figure by the \$ sign, but not by the \$ sign; the latter cancels the effect of the numeric tab. Rather annoying if you work in English currency.

There is a useful 'Caps Mode', selected by hitting the up-arrow key. This causes all the alpha characters to be printed in upper case, but leaves the other keys unaffected; much better than using 'shift lock', which affects the whole keyboard.

Another nice feature is the ability to assign commonly-used phrases to a single key. 'Check mark' 57

a-Ministry of Education will assign that string to the letter a, and when you want to use the phrase you touch the left-arrow key; the prompt 'key?' then appears on the complete phrase into the document

This is one area where Paperclip really shows the rest how to do it. Each type of printer has its own 'printer files' on disk specifying all the various codes needed to perform the standard functions. Before you do a print you load the printer file for your own printer; this allows almost any type of printer to he used efficiently.

If your printer is not specified you have only to create your own 'nrinter file' to be able to use it, and detailed instructions for that are in A useful feature for producing

neat documents is the conditional hyphen. Because you don't know in advance where your words will appear it is not possible to hyphenate words as you type them in. Using the conditional hyphen in long words means that the hyphen only appears if a word needs to be While it is not really aimed at the

complete beginner it does cover all the facilities and is clearly laid out. It is easy to read, too, and there's a good summary of all the commands and control functions at the back with a list of error messages and their meanings.

Apart from not formatting the text as you type and the limitations of

the 'preview' feature there is little that has been left out. I can think of few jobs that this package could not handle. Other facilities

Paperclip uses the colour facilities

of the 64 well. Function keys 2, 4 and 6 change the character, screen and background colours respectively. Two features which really make

this package a cut above the rest are the alphabetic column sort and the column manipulation. The former lets you enter columns of text such as addresses and then sort them by 'fields' into alphabetical order.

The other one allows columns of figures (or text) to be moved, copied, deleted and inserted as well as doing simple addition or subtraction on both rows and columns. Having done your arithmetic you can place the result anywhere in the document.

Headers, footers and automatic page numbering are all provided, allowing professionallooking documents to be pro-

Conclusions

At £98-90 this is probably one of the most expensive WP packages currently available for the 64. For-If you don't really need all of them however, you might be better of tunately it is also one of the most looking at something a bit cheaper comprehensive, with a number of

features that leave other WP programs way behind

If you want all those facilities there is really no other choice; the other packages just can't compete

duced. You can also save and load blocks of text allowing letters to be created from standard paragraphs. As you would expect the normal mail-merge facilities are also present.

The disk commands are exten sive - typing CTRL > give the full range. Files can be saved either as normal PRG files using CTRL S or as SEQ files using CTRL Z (files can then be created which other programs can read). The disk directory can be displayed by the cursor to the file name and typ

CTRL 0. You can even load a file from the directory list by moving ing CTRL L - if you then hit RUN/ STOP the file will be loaded: very Other good features include the ability to print multiple copies of a

document and allow multiple spacing between lines on the out-The manual

This is a very large document indeed, and it's comprehensive though regrettably there is no index; you have to look through the contents pages each time you want to find something.

Paperclip on balance

- . Text creation and editing facilities are very easy to use with a good range of block
- . Files can be saved as either text or data . Excellent range of printer options, using printer files'
- Large range of formatting commands · Alphabetic column sort
- . Ability to manipulate columns easily and do simple arithmetic on columns or rows
- printing, but for Search/Replace and Find

. Text does not appear on the screen as it will be printed • Formatting commands cause the screen to look rather cluttered · Rather expensive

Another Basic extender

ULTRABASIC for the 64 reviewed

by Mike Todd

In December Mike Todd looked at two Basic enhancement packages for the 64—Simons Basic and BC Basic. Since then we've found another such package for him to get his teeth into. ULTRABASIC-64 was written in the USA by Roy Wainwright (stalwart of a company over there called Abacus and probably best known for Abacus's music and graphics tools for the Vic. ULTRABASIC is available in the UK through Adamsoft at £22.95 for a cassette or £24.95 for the disk wersion.

Being on disk or cassette means that ULTRABASIC must be loaded at the start of a session and this is done in two stages.

stages.
First, the appropriate laitfaliseer program is loaded depending on the type of printer you are using. It will cope with a Commodore 1515 or 1859 printer, or an Epson MX-80-TX-80 connected via the user port. (If the Epson option is chosen, you're asked if a line feed should be sent to the printer after each carriage or the commodor of the printer after each carriage or the printer after each carriage.

printer after each carriage return.)
Once this is RUN, the main part of ULTRABASIC is loaded sutematically... followed by a frustrating 18 seconds of animated title page. Only when this has finished its antics is ULTRABASIC installed and ready for used.

Controls

At this point, three of the function keys are set up as special control keys. Pressing F7 will switch over to the graphics screen (which at this point still has the title page on 3); F5 will revert back to text. F1 will turn off any sounds that may have been accidentally left.

And what do you get? Well, for a start there's what you don't get — UITRABASIC has no programmer's aid type commands, no extra arithmetic or string commands, and no structured programming facilities — other than an unusual loop control feature which is discussed later.

Graphics Setting up the graphics screen

is simple. HIRES or MULTI commands specify the colour of the screen and border; and there is the usual range of piotting commands for plotting points, drawing lines, circles and boxes and for putting text on the screen all with the origin of the screen (0,0) at the bottom left.

There are size a few unexade commands. The place title matrix along the releast of the display screen, for true as axes in graphs, CHARR puts normal-size characters on the liveus axives and large characters on which clares a labol of the specified colour. The BLOCK command in particularly unusual, for in liveus mode the secreth background so that normal politing can still be done over the top of it.

Each of these graphics commands is performed in the specified colour, with multicolour mode allowing three 'paintbrushes' (as the handbook calls them). They are specified by adding zero, 100 or 200 to the plot colour.

or 200 to the plot colour.

The MODE command
determines whether points and
lines should be set, erased or
inverted. Once the mode is set,
all graphics commands are
performed in the specified
mode until it is chanced.

There is also a FILL command; but as confusion can occur in multicolour mode as to which lines represent the area boundaries, it is possible to specify which 'paintbrush' was used to draw the boundary.

The graphics screen can be saved on disk or cassette though the large quantity of data involved means that this takes a long time: up to 80 seconds on disk, very much longer for tape. It is also possible to print the graphics screen on an Epson MX80/ FX80: or on a Commodore 1515 (with the upgrade ROM) or a 1525E. The handbook points out that printers connected through an IEEE interface will not work, and the Epson must be connected using a user-port-to-Centronics-interface cable

Turning Turtle

As well as the conventional graphics commands, ULTRABASIC provides for TURTLE graphics. These are based upon the idea of controlling a mobile drawing machine (called a "Turtle") and directing it to turn and move with its pen up or down.

When the turtle mode is selected, a picture of the turtle appears on the screen at the

specified co-ordinates. From now on its movement is controlled using the TURTLE commands.

TURN will turn the turtle through a specified angle (in degrees) and MOVE will move it a given number of dots in the

direction it is nointing This type of graphics plotting is extremely easy to use, although a little slow; but the turtle itself can be turned off (using BYE) and this does speed up plotting considerably. If at any time you need to know where the turtle is, the direction it is pointing and its X and Y co-ordinates can be

Sprites

read

Sprite definition in III.TRABASIC is done by either 'drawing' the sprite using 1s and 0s (numbers 0 to 3 if defining a multi-colour sprite) or by using hex or decimal representations

The decimal definition is far more versatile than the handbook shows since the numbers (which are incorrectly shown in the handbook as being within quotes) can be any numeric variable. So there is the possibility of setting up sprite definitions from disk or cassette.

Sprites are positioned using the PLACE command and can be rotated through 90 degrees at a time using ROTATE. There is no sprite move facility, and this must be done

by repositioning the sprite using PLACE; but there are commands available to determine when specified sprites have collided with themselves or with the background.

Sound There are two ways of nerating sound using HITRARASIC. The SOUND

specified voice at a given pitch for a given length of time; GEN allows the sound generator parameters involved to be set up if the default values are not required. As well as setting the overall volume, VOL will also allow the filter parameters to he set

The second method involves setting up tune data statements using the TDATA command, generator using SET, and then playing them with the TUNE The data required is

complicated to set up and needs to be written in hexadecimal notation. It allows a specific pitch to be selected continues. It is really far too complex to be used for playing 64

tunes, but could be useful for games sound effects.

Pitch is determined using the numbers 0 to 127 which generate specific notes according to a table included in the handbook, and there is limited scope to tune between

III.TRABASIC also includes a rather unusual but useful loop control facility. It's rather like a FOR/NEXT loop - only different. A loop is set up as follows:

127: X-X+1: PRINT X:1

notes

That will cause the instructions within the square brackets to be executed 27 times. Although the handbook implies that this figure should only be a constant value, it is possible to use any legal arithmetic

expression to control the loop The loop itself can consist of several lines of Basic code: and loops can be nested within ups, up to a maximum of 30 EXIT can be used to leave the

Conclusions

The fact that it is easy to switch between the text and graphics screens using the F5 and F7 keys (or NORM and GRAPH commands) made experimenting with the package extremely easy. when the F-key switching stopped working. Further investigation showed that the interrupt pointers had been changed by ULTRABASIC and this also meant that the 10 counting.

Because graphics and text screen must share a commo colour memory, ULTRABASIC preserves the colour memory of a graphics screen when flipping back to text mode. But it does not save the text-mode colour memory and instead just fills it with a single colour when you flip back to text. It also means that care should be

the text screen whilst displaying the graphics screen

The main attraction of ULTRABASIC is certainly the inclusion of the TURTLE graphics commands. And for those alone, it may be worth considering - although there are other (and more versatile) packages available for those who want to specialise in this form of graphics control. The overall range of

commands is restricted. But at least the graphics commands are simple to understand, and they do contain the most frequentlyneeded features. Sound control though is limited and can be difficult to use

Overall: a good but limited package. At least it comes complete with a demonstration program as well as two tutorial programs describing how the

Business management on tape

Quick Count's Cash Trader Bookkeeper reviewed

by Tony Harrington

Ouick-Count's 'Bookkeeping system for the Cash Trader' is a very interesting attempt to provide a complete cassette-based business system for the 64. The title says a great deal about the approach Quick-Count has taken. It really is designed as a basic 'do-it-yourself' bookkeeping system and the knowledge of accountancy or bookeeping that you need to run it - with one important exception - is minimal. Tony Harrington checks it out.

sales ledger and no purchase most part off ideas that everyone have cash coming into the company and cash going out of on a weekly basis, and you've Inevitably though, to be really beyond the basic level. And this mentioned above comes in. The package has to pull together and summarise the data that is keyed is from week to week. And at this point the user with no bookkeeping knowledge at all will find him/herself encountering terminology. Words like 'nominal

and 'balance sheet' becomes This shouldn't come as a surprise though. The excellent little 17-page manual that goes with the system warns that you will need some idea of how books are kept. This is because the 79 page individual accounts that the system allows in its nominal ledger are already divided up, by Quick-Count, into profit and loss account and balance sheet. "If you are in any doubt how these accounts should apply in your business", the manual says, "you would be well advised to take the advice of a bookkeeper before starting out".

That is sound advice, and

shouldn't cost you more than a

Getting started

The first question that faces a new user of any system is 'how do I get going?. In this respect Cash Trader is well designed. Once the package has loaded - a procedure that the manual warns will take 10 minutes (and it does) the opening menu on the screen contains the following

In isolation these labels are a bit obscure. But the manual provides clear and detailed instructions. The first step is to choose option 3 to tell the system some

know when you first implement the program

The first of these is whether or not you are using a printer. As a option of doing without a printer if I so wish. But it is not good bookkeeping practice. You will system and if you don't have a printer you risk losing the transactions. At certain times, for example, you will be using routines which clear detailed transactions out of the computer's memory and just retain balances. If these details disappear from your memory as well, you will be left with a set of figures that won't mean a thing to anybody The manual, once again.

sounds a clear warning here: "If you are not using a printer you will have to write down in detail every item you post, as shown on the screen. But the whole business of manually transcribing data from a screen leaves the door open for all kinds of inaccuracies to creep in. You might miss something or get the figures the wrong way round. Why take the risk?

between a standard ASCII printer and a CBM printer. It uses a limited character set, so If there is a printer connected.

procedures will dump everything that is on the screen down to the display and posting routine you get a message on the screen asking 'Printer ready? Press Y or N. If you press N. the program assumes that you haven't yet

The Utilities menu has eight

Alter date Alter VAT rates

Pressing the 'up arrow' key automatically steps you back through the sub-menus to the main menu, so there is never any difficulty in finding your way about the system. You might not understand it initially, but you will be able to move from screen to screen quite freely without getting trapped. This is a definite plus, since you can experiment and feel your way, confident that you will not be doing any damage to any part of the program.

In operation

The actual operation of the package is simple enough once you have grasped the relationship between the two parts of the system. On the one hand, it presents you with a way of recoording takings and expenditure on a weekly basis. On the other, it distributes the takings and expenditure among the nominal ledger accounts.

A nominal ledger aims at providing an overall picture of what is happening to a business. It consists of a number of different account headings, like bank account, cash account, senting account, setting account, setting accounts, purchases accounts

In Cash Trader, some of these headings are already defined for you, others you can define yourself. You would need to do this if you felt that there were important zeras of income or expenditure which you wanted to identify and keep track of during your trading year, that are not cleanify and her brokelow. Trader, and the second trading the second trading the second trader and the second trader second trader second trader second trader second trader.

set aside for the Trading Account, numbers 20 to 49 relate to the Profit and Loss Account and the remaining numbers (90 to 79) are Balance Sheet

Although a maximum of 79 nominal ledger accounts would be too restrictive for a big business, most traders who would contemplate a system like this should find themselves able to fit their business into it quite happily.

Option 2, Set up', automatically

creates the skeleton nominal ledger. My only quibble here is that there is no list provided in the manual of the account description set up by Quick-Count. To find out what these are, you have to move to another menu and page through each

This is the only way to sort out which account numbers have already been defined and which haven! I found accounts called hire-purchase, "heating," rent and so on. The manual should really have contained a detailed Nominal Ledgers accounts hist.

Other options on the Unlities menu are more or less self explanatory. The system will cater for three different rates of VAT (you only need one at the moment), and if the law changes you can key in the new rate or

rates in seconds using option 4.

Once you have told the system what the current date is and what the standard VAT rate is (15%), you're ready to go. Option one on the main menu (Post') brings up a new screen with four

Daily Takings
 Payments in Cash
 Payments from current
Bank A/C

When you start off with the

Press Y or N). This requirement saves a lot of time in recovering from errors.

The Journal routine is particularly useful when you pay cash into your bank account for any reason. You would use option 4 to debt AlC no. 59, current bank account, and credit AlC no. 69, cash account (if you don't understand why you would be debting the bank account when paying cash into it, have a chat with someone who

Daily take

The 'Daily Takings' option is the heart of the system. It is easy to follow if you step through the cash all you need to do is enter two takings totals for that day. In this respect it is a very simple, flavible system

includes interested too, to see that the system gives you the means to treat American Express and other credit cards differently from Bacciays and Access card your bank second and are immediately credited to you by the bank! The credit card to the bank! The credit card other card companies separately. When you are seen the cash by the card companies separately. When you are sent the cash by the card companies separately crediting the credit card suppose as sent the cash by the card companies separately with the card companies separately are supposed to the card companies separately with the card companies separately are supposed to the card companies separately are sent the cash by the card companies separately are sent the cash by the card companies separately are sent to the card companies and settlements.

opening balances (ie. the amount in key accounts such as the bank account and the cash account.) This is done using option 4. Each journal transaction has a threedigit number; you can either input a specific number, or allow the system to start at 'I' and increment one each time. Cash Trader is a double-entry

system which should always balance out to zero. So when you debit a particular account with an opening balance, you have to credit AC no. TI, the Opening Balance Control account. You are given 16 characters to describe the reason for any journal

Another sound feature of this package is that in any posting routine, before any transaction is stored in memory, you are asked to confirm that everything has been entered correctly (OE? menu. Like the payments sections (options 2 and 3) this section is based on a seven-di week.

The first thing the program

asks for is 'Day' (press 1, 2, 3, 4, 5, 6, 7 or the up-arrow, where Monday is day one and so on: up-arrow exist from the menu). Having selected the day for which you want to enter takings, there are two more choices to be

which you want to enter takings, there are two more choices to be made. You have to decide if you are posting takings for normal goods or for 'special' items, like the sale of some asset of yours. Second, you are asked to key

1, 2 or 3 to debit cash, bank or credit card suspense accounts respectively. If you unasily treat all your takings as a cash float, you can dump all the takings to the cash account (no. 60) by keying 'l'. If you bank some of the takings and keep the rest as

Next, you are given a chance to enter the amount and to confirm that all the entries you have made are correct. At this point the system debits the cash, bank or suspense account (whichever you instructed) and credits an account called "takings" (if you entered the takings as normal goods, it credits the 'assets' account if you entered the takings as normal goods, it credits the 'assets' account if you are the properties of the country of the properties of the takings as normal goods, it credits the 'assets' account if you said the takings resulted from

This is a perfectly solid way of building up a picture of a week's takings. Note that it is not individual items sold on each,day but only the total summary

Outania

Of course, takings are only ha of a business. There are also

unfortunately, or we'd all get rich

your cash float, or cash account) it gives you the option of paying

The payment routine is slightly different from 'takings'. You have to input the date of each you are given a three digit transaction number (which you could use as the last three cheque, for example). You have enter the reason for the payment

There is also a very reasonable VAT system on payments made from the bank input 'S' for standard rate, and the system will ask for the gross navment amount to be input. It will then work out the VAT account. If the payment is zero rated or exempt, you can flag it as such. (I wasn't entirely sure

why this VAT facility wasn't also part of the cash payments

The next step is to credit the full value of the net invoice to whatever nominal ledger acc system automatically reduces the navment by the amounts you too, is a fairly sophisticated feature to find on a cassette

Finally there is the reporting side of the system. This should Option 2 on the main menu

based package.
